GERMICIDAL EFFICIENCY maintained in the presence of organic matter.

In the conduct of labour 'Dettol' possesses marked superiority over carbolic and cresylic antiseptics. 'Dettol' has a Rideal Walker co-efficient of 3 0, yet 'Dettol' can be used at really effective strengths — without discomfort, danger or staining. 'Dettol' maintains high bactericidal efficiency in the presence of blood and other organic matter 'Dettol' is a clean, clear, non poisonous fluid — with a distinctly pleasant smell.

Sold by Chemists and Medical Suppliers in bottles 1/-, 1/ 3, 2/-, 3/-, 5/- and 7/6 and in larger sizes for Medical and Hospital use. The prices do not apply in Eire or Overseas. Samples and full information on request

Intestinal Disorders *consequent upon Bronchial Infection*

Partly owing to the considerable amount of sputum inevitably swallowed by the patient in bronchial affections (especially in children) disorders of the digestive organs may be produced

A suitable diet and a free daily evacuation tend to prevent these disorders

Andrews Liver Salt by its effervescence freshens the mouth (often so dry in bronchitis) and by its antacid reaction counteracts gastric catarrh By producing an easy evacuation, safe even in the presence of myocardial degeneration, it removes the organisms introduced by the swallowed sputum

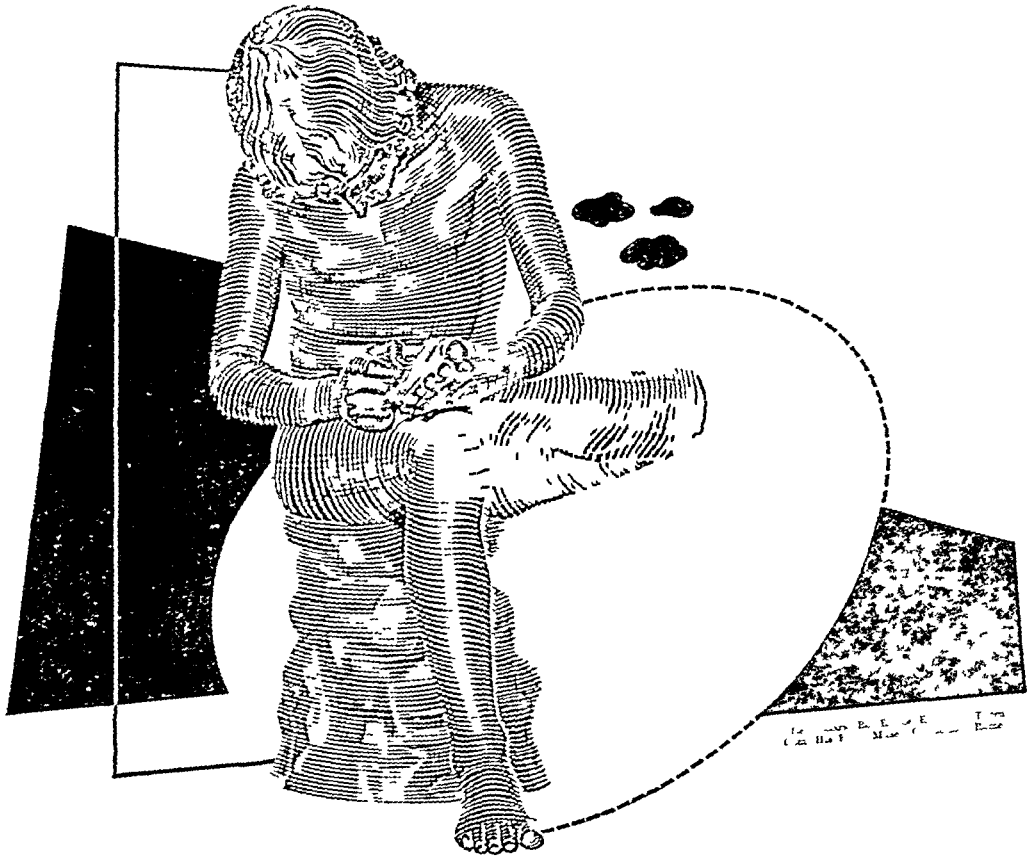
NEW IRON THERAPY



The dosage of 'Plastules' is 3 capsules per day. This small dosage is made possible by the use of Ferrous Iron and Yeast in a semi-fluid and stable form in plastic soluble capsules. It is now recognised that maximum benefit from iron therapy is obtained by using Ferrous Iron—the form in which iron is the most readily assimilated

The addition of Yeast acts as a catalyst and potentiates the value of the Ferrous Iron. 'Plastules' with Liver Extract are fortified with additional anti-anæmic factors. Prescribe 'Plastules' for cases of anæmia and debility and note the immediate general improvement in the patient's condition

TETANUS-GAS GANGRENE ANTITOXIN

GLOBULIN Lederle MODIFIED

containing —

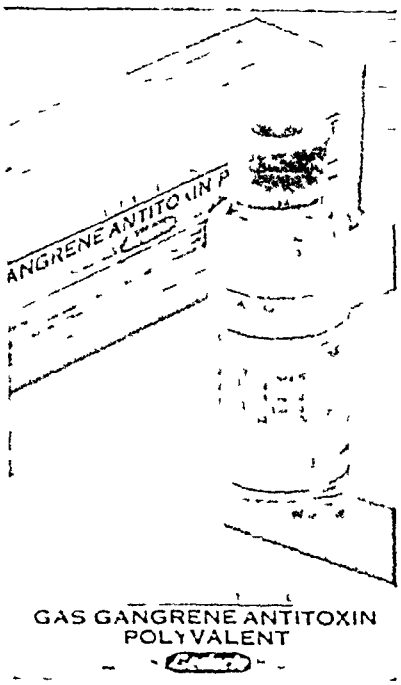
3,000 units Tetanus Antitoxin (Cl tetani)
2 000 units B perfringens Antitoxin (Cl welchii)
2 000 units Vibrion Septique Antitoxin (Cl oedematis maligni)

These two gas gangrene antitoxins have been included in this prophylactic dose because B perfringens is recognized to be the most frequent, and Vibrion Septique next in frequency, in the cause of gas gangrene

Where symptoms of gas gangrene infection have become manifest, early therapeutic dosage of Gas Gangrene Antitoxin is indicated

GAS GANGRENE ANTITOXIN (*Polyvalent*)

GLOBULIN Lederle MODIFIED



contains effective therapeutic dosages of antitoxin for *all five* toxin-producing anaerobes now credited with causing gas gangrene in man

(B perfringens Vibrion Septique, B oedematiens, B sordellii B histolyticus)

The fact that there is no short-time test to determine which of these toxigenic, anaerobic bacilli is the cause of a given gas-gangrene infection provides the logic for combining these five antitoxins in the treatment dose

While it is recognized that the most frequent offender of these organisms is B perfringens, analyses of soils and dusts have shown that the incidence of the other organisms is by no means insignificant

The bulk of the dose is not excessive, for the Lederle "Globulin-Modified" method of refining has effected a marked reduction in bulk and in the reaction causing serum proteins

"COMMON COLD"

AND

ANTI-CATARRH VACCINE (EVANS)

(LOCAL STRAINS)

For Prophylaxis and Treatment

The facilities of the pathological laboratories at **EVANS BIOLOGICAL INSTITUTE** enable us to issue vaccines prepared from organisms collected in the locality in which the vaccine is to be used It will be appreciated that such vaccines are highly specific, producing a greater proportion of successful results than is usual with ordinary Stock Vaccines

The following formulæ have been evolved after many years' experience, as having a comprehensive selection of organisms as found in numbers of typical cases, in the correct proportions

COMMON COLD & ANTI CATARRH VACCINE (EVANS)
(No 3, for Prophylaxis)

M catarrhalis	200	*million*	per cc
Diplococci pneumoniæ	200	,,	
Streptococci	200	,,	
B Friedlander	100	,,	
B septi	100	,,	
Staphylococci (alb et aur)	200	,,	
M tetragon	100	,,	
B influenzæ	100	,,

DOSAGE—PROPHYLACTIC (Vaccine No 3)

As different patients vary in their reaction to vaccine treatment it is only possible to suggest the average procedure A brochure which deals fully with the question of dosage will be sent on application In general a series of three injections (given before the season during which the person is usually susceptible) is recommended The initial dose is 0 25 cc followed by 0 5 cc after an interval of seven days and a further 1 cc after another week or so

DOSAGE—CURATIVE (Vaccine No 1)

In acute conditions an initial dose of 0 1 cc or 0 2 cc and in chronic conditions 0 25 cc The initial dose may repeated after three days If no reaction is produced subsequent injections can be larger

COMMON COLD' AND ANTI CATARRH VACCINES (EVANS) (Local Strains) are issued as follow

Boxes of 3 1 cc Ampoules No 3 Vaccine (Prophylaxis) 7/- per box
Boxes of 6 1 cc Ampoules No 1 Vaccine (Treatment) 14/- per box

Also in 5 cc. 10 cc and 25 cc bottles and in single Ampoules

VERTIGO

ITS NEUROLOGICAL, OTOLOGICAL, CIRCULATORY, AND SURGICAL ASPECTS*

BY

W RUSSELL BRAIN, D M, F R C P

Physician with Charge of Out patients to the London Hospital Physician to the Maida Vale Hospital for Nervous Diseases

The Nature of Vertigo

The word vertigo by its derivation implies a sensation of turning either of the body or of its surroundings and it is so defined in the dictionaries We need however a word to describe any subjective accompaniment of disordered equilibrium whether this be a sense of rotation or not and I propose therefore to use vertigo in this extended sense and to define it as the consciousness of disordered orientation of the body in space

There are three main ways in which the spatial orientation of the body may be felt to be disordered (1) The external world especially the world as seen may appear to move Such hallucination of movement is by no means always one of rotation (2) The body itself may be felt to be moving again not always in a rotatory fashion or the sensation of movement may be referred to within the body—for example within the head (3) Finally the postures and movements of the limbs especially the lower limbs in standing and walking are felt to be ill adjusted and unsteady

To understand how vertigo arises it is necessary to begin with the physiological basis of the orientation of the body in space Fundamentally this is reflex and therefore unconscious As is well known an animal which has undergone a transection of the brain stem above the level of the red nuclei is capable of adopting a normal posture and of readjusting itself to this posture by means of righting reflexes if it is displaced from it Such an animal deprived of its cerebral hemispheres, is dependent upon the labyrinths and the proprioceptors of the muscles and joints of the limbs and spine for the stimuli which evoke from the centres of the brain stem and cerebellum a co ordinated and within limits appropriate reflex response

The role of the cerebral hemispheres in spatial orientation is to bring these reflex mechanisms into the service of the conscious perception of the external world To achieve this the cerebral cortex must link together (1) afferent paths excited by stimuli from the exteroceptors especially the retinae which in the perception of visual space are closely associated with proprioceptor impulses from the ciliary and extra ocular muscles (2) proprioceptor impulses from all parts of the body which yield information as to the position of the body in space and of its parts relatively to one another and (3) efferent paths through which voluntary movements modify the position of the body in space

These are the two great corticifugal paths—the pyramidal tract which links the precentral cortex directly with the anterior horn cells and the fronto pontine and temporo pontine fibres which bring the cortex into connexion with the cerebellum and so in directly with the red nuclei the postural reflex centres of the mid brain

THE PSYCHO PHYSIOLOGICAL ASPECT

Vertigo however is a state of consciousness and we must now consider it from a psycho physiological point of view In this task the methods of Gestalt psychology are helpful There is a large field of conscious phenomena which are perceived as localized in space Within this field we distinguish that portion of space occupied by our own body from the rest The body is represented by a constantly changing model—a plastic schema to use Head's (1920) phrase The external world is represented by another schema also constantly being modified These two schemata however are far from independent of each other since the bodily schema receives contributions from proprioceptors such as the labyrinths which are in part stimulated by an external force gravity and on the other hand the perception of external space includes in its raw material proprioceptor impulses The two schemata therefore to some extent interpenetrate one another and must be conceived as functional and not as structural units For consciousness the orientation of the body in space is normally an orderly dynamic relation between the bodily schema and the schema of the external world Vertigo is the state of consciousness which arises when this relation becomes disordered

Two illustrations may help to make this clear As Hughlings Jackson (1932) pointed out the simplest form of vertigo is that which is produced by paralysis of an ocular muscle This is due to faulty projection of the

* Read in opening a discussion in the Section of Neurology and Psychological Medicine at the Annual Meeting of the British Medical Association Plymouth 1938

visual field of the affected eye, as a result of which the patient is presented with two mutually conflicting visual spaces. The second illustration, which I owe to Hartmann (1935), is especially interesting in view of the important part which hallucinations of movement play in the symptomatology of vertigo. The perception of relative movement between the body and the external world must depend upon a certain functional relation between the bodily schema and the schema of the external world. It is not difficult to devise an experiment whereby a rotation of the visual field causes an hallucination that the body is moving in the opposite direction although the subject remains seated throughout the experiment in a chair. A familiar example of the same hallucination is the experience of a person seated in a train who, when a train beside his own begins to move, feels that his own train is moving in the opposite direction. It is clear from this and other observations that whether a perception of relative movement between the body and the external world is referred to the body or to the external world depends not only upon the content of visual perception but also upon the state of the bodily proprioceptors at the time, especially those of the ocular muscles and the labyrinths. If, owing to labyrinthine disease, a patient feels as if his body is in violent motion in a certain direction and if nevertheless the objects at which he is looking remain in front of his eyes, he will experience an hallucination that the external world is moving in the direction in which he feels himself to move, for although he feels himself to be moving there is no cortical process corresponding to relative movement between his body and the external world. The latter, therefore, is perceived as moving in the same direction as the body.

It is worth noting in passing that the fact that a person can experience an hallucination of rotation of both his body and the external world in the same direction implies a space in reference to which they are perceived as rotating, and which itself remains stationary. It appears therefore that our schemata of both the body and the external world are built up within an absolute space which is conditioned by our sensory organs and nervous system and which forms a frame of reference within which the whole visible world including the body may be perceived as moving. This purely personal absolute space is one of the obstacles which the non-mathematical student encounters in trying to grasp Einstein's conception that all movement is relative.

Since vertigo is a state of consciousness in which [illegible] elements play an important part it is mediated by [illegible] cortex even when it is the outcome of an [illegible] lower level. It follows that [illegible] cortex may cause vertigo. Foerster [illegible] in the course of electrical stimulation of the [illegible] patients has observed that [illegible] the stimulation of the interparietal sulcus [illegible]. The patient sees the objects [illegible] towards the contralateral side [illegible] stimulation of the [illegible] eyes. It is [illegible] that [illegible] may [illegible] body [illegible] and [illegible].

moving and which is felt to be stationary probably depends upon the pre-existing background provided by the state of the proprioceptors of the body.

Vertigo as a Symptom of Disorder at Different Levels

It follows from the anatomical and physiological considerations already outlined that vertigo may arise as a result of a disturbance of function at many different levels. We therefore recognize (1) psychogenic vertigo, (2) vertigo due to cortical disturbances, (3) vertigo of ocular origin, (4) vertigo of cerebellar origin, (5) vertigo due to brain stem lesions, (6) vertigo due to lesions of the eighth nerve, and (7) aural vertigo. In diffuse conditions such as head injury and circulatory disease, it may be impossible to say whether the vertigo is cortical, brain stem, or aural in origin.

(1) *Psychogenic Vertigo*.—"Giddiness" is a common complaint among sufferers from anxiety neurosis. There is no sensation of rotation, but the patient describes "a feeling as if I am going to fall," which usually occurs only when he is in the street, especially alone, and may be so severe that he is unable to go on or has to return home. A closely related neurotic symptom is "a feeling as if I am walking on air." Psychogenic vertigo is usually associated with severe feelings of anxiety and the symptoms of over-activity of the sympathetic nervous system. At the psycho-physiological level neurotic vertigo can perhaps best be explained as the effect of bringing into consciousness elements in spatial orientation (the relation of the body schema to the external world schema) which are normally unconscious, the cause of this being that this physical relationship has become for the patient symbolical of a psychological relationship between himself and his environment which is a source of difficulty to him. Such a process of symbolization is well illustrated by the double (physical and moral) meaning of the words 'lapse,' 'fall,' 'fallen' and 'downfall.' Vertigo may also occur as a conversion symptom in hysteria.

(2) *Vertigo due to Cortical Disturbances*.—Foerster's observations, previously described, explain how an epileptic cortical discharge may cause a feeling of vertigo as is not uncommon in petit mal, and how vertigo may arise as a symptom of migraine or of localized cortical lesions. In cases of intracranial tumour, however, vertigo is of no localizing value, since it may occur with tumours in any situation (Symonds, 1933).

(3) *Vertigo of Ocular Origin*.—An explanation of vertigo associated with diplopia has already been given. Vertigo may also arise as a result of a difficulty in adapting the posture of the body to an unusual visual environment such as a rapidly moving train seen from the railway platform. Vertigo on looking down from a height is a similar experience.

(4) *Vertigo of Cerebellar Origin*.—The role of the cerebellum in the causation of vertigo is difficult to assess since many cerebellar lesions may involve vestibular fibres in the eighth nerve or the pons, and [illegible] vertigo may be slight or absent in spite of a lesion of the cerebellum especially if it is confined to the [illegible] lobe. Nevertheless, the [illegible] probably does not [illegible] vertigo of cerebellar [illegible] especially when [illegible] involves [illegible] which is closely linked mechanically with [illegible] system. This [illegible] may [illegible] the [illegible] objects [illegible] and [illegible].

aural vertigo by the absence of deafness and tinnitus and the presence of the characteristic analgesia and thermo anaesthesia of the face on the side of the lesion and of the body on the opposite side due to the medullary infarction

(5) *Vertigo due to Brain stem Lesions*.—Vertigo may be caused by vascular or neoplastic lesions of the brain stem but is most strikingly seen when disseminated sclerosis involves the pons A young adult is suddenly attacked by severe vertigo accompanied by conspicuous nystagmus and sometimes vomiting and prostration severe enough to cause confusion with aural vertigo The absence of tinnitus and deafness however the presence of other signs of a pontine lesion especially paresis of one external rectus or of conjugate lateral gaze and facial paresis together with other signs of dis seminated sclerosis and in some cases a history of previous nervous symptoms enable the correct diagnosis to be made In most cases moreover the vertigo as a rule lasts for several days considerably longer than an attack of aural vertigo usually does

(6) *Vertigo due to Lesions of the Eighth Nerve*.—Vertigo due to a lesion of the eighth nerve especially acoustic neuroma since it is associated with deafness and tinnitus closely simulates aural vertigo Vertigo due to pressure upon the eighth nerve by abnormal vessels has been described by Holmes (1924) and Dandy (1937)

(7) Aural Vertigo

Vertigo is a symptom of a large number of pathological states of the ear concerning which there are still many unsolved problems I shall leave on one side the varieties of acute labyrinthitis including infection of the internal ear secondary to suppurative otitis media and I can only mention the interesting question of the role of the otoliths in vertigo I shall confine myself to certain problems associated with Meniere s syndrome

MENIERE S SYNDROME

Recurrent aural vertigo arising in a previously healthy person is a clinical entity though we cannot yet say whether it is also a pathological entity The term Meniere s syndrome is used to day less often than formerly partly perhaps because a false idea of what Meniere described has been perpetuated by those who have not troubled to read his original communications (1860–1 1861) It is said that Meniere reported an example of spontaneous haemorrhage into the labyrinth a rare condition which clearly is not responsible for re current aural vertigo It is true that Meniere did briefly report such a case to demonstrate that vertigo might be produced by a lesion of the labyrinth but he also gave a clear and masterly account of all the essential clinical features of recurrent aural vertigo

I would therefore urge the retention of the term 'Meniere s syndrome to describe the disorder char acterized by the features to which Meniere originally drew attention—namely (1) the sudden onset in (2) a previously healthy auditory apparatus of (3) functional disorders consisting of (4) continuous or intermittent tinnitus with (5) diminution of hearing and (6) vertigo uncertain gait rotations and falling which are accom panied by (7) nausea, vomiting and a syncopal state Finally he noted (8) the progressive character of the deaf ness and observed that the hearing might be suddenly and completely abolished

There is little that the modern clinician can add to this classical description except perhaps to mention (9) the transitory loss of vision which may occur without loss of consciousness during an attack (Gowers 1907) and (10) transitory diplopia It is important to remember that double vision may occur as a result of vestibular dis order lest this symptom should be attributed to ophthal moplegia and ascribed to a lesion of the nervous system The two images are seen one above the other and the diplopia is doubtless due to skew deviation of the eyes a disorder of ocular posture emanating from the labyrinth and sometimes occurring transitorily as Cairns and I have shown (1933), after section of the auditory nerve It is also important to note that as Meniere observed, loss of consciousness may occur in the course of a severe attack of aural vertigo and such attacks require to be distinguished from epilepsy

AETIOLOGY OF MENIERE S SYNDROME

Men suffer from Meniere s syndrome more often than women in a proportion of about three to two Age is an important factor Meniere s syndrome is a disorder of middle age especially late middle age The age of onset of vertigo in a series of forty one of my own patients is set out in the following table the average being 49

Age	Number	Percentage
10–19	1	2 4
20–29	2	4 8
30–39	6	14 6
40–49	9	22 0
50–59	8	19 5
60–69	13	31 7
70–79	2	5 0

This age incidence suggests the operation either of a degenerative factor or of some process requiring many years to cause symptoms

There are two unusual types of patient however who do not accord well with the conception of a progressive disorder Whereas the usual mode of onset is for tinnitus and deafness to precede vertigo by only a few months or at most a year or two it occasionally happens that a patient who has been deaf in one ear for thirty or forty years suddenly develops vertigo Here perhaps we are dealing with two different processes one of which is superimposed upon the other Even more puzzling are those unusual patients whose vertigo occurs at extremely long intervals Thus a trained nurse aged 50 had a severe attack of giddiness and vomiting in 1918 another in 1932 another in 1937, and another during which I saw her in 1938 Occasional very mild attacks occurred in the intervals but tinnitus and deafness were absent

Focal aetiological factors include infection of the teeth tonsils and nasal sinuses, and I agree with Wright (1938a 1938b) that focal sepsis is the most important single aetiological factor I invite discussion as to whether the recurrent vertigo which is sometimes asso ciated with blockage of the Eustachian canal is a pathologically distinct variety of aural vertigo

Abnormalities of water metabolism have been empha sized by Mygind and Dederding (1928–9) Dederding (1929 1931) and Nielsen (1931) Nielsen has found that sufferers from Meniere s syndrome tend to retain water in the body while Furstenberg and his collaborators (1934) have precipitated attacks by giving chloride and so causing water retention and both Dederding and Furstenberg have relieved them by dehydration The affinity between recurrent aural vertigo and migraine was first pointed out by Meniere himself and has lately been

stressed by Dederding There are certainly clinical resemblances, and the association of the two disorders in the same patient is not uncommon Allergy may in some cases be a common basis (Balyeat, 1933)

The recent valuable observations of Cairns and Hallpike (1938) who have demonstrated a gross dilatation of the endolymph system in two cases, have made it easy to understand how changes in the osmotic tension of the blood reflected in the distended endolymph channels might cause variation in the symptoms and so explain the periodicity of the vertigo and also the fluctuations in the hearing noted by Dederding (1929) It seems unlikely, however that disturbed water metabolism is the primary cause of the disorder, though it may well be a contributory factor Here there are suggestive analogies with glaucoma In the present state of our knowledge it seems best to regard Ménière's syndrome as the end-result of a toxic or toxi-infective process in the labyrinth —Wright's "focal labyrinthitis"

Treatment

If this view is right it follows that the eradication of any source of infection is the most radical form of treatment Tobacco must be included among the exogenous poisons to which the labyrinth may be unusually susceptible in some individuals When the intake of fluid can be shown to be excessive its restriction may be helpful, though few patients will tolerate the heroic measures sometimes recommended Restriction to one and a half pints of fluid daily should not involve hardship Striking improvement sometimes follows lumbar puncture, possibly as a result of its indirect effect upon water metabolism Phenobarbital in ½ grain doses two or three times a day is most valuable Cooper (1938) and Starr (1936) claim good results from certain choline compounds in a small series of patients Most patients respond well to medical treatment if it is sufficiently thorough and comprehensive Resistant and incapacitating vertigo, however, will rightly force the physician's hand, and surgical measures must then be contemplated As in trigeminal neuralgia the choice lies between alcoholic injection and nerve division Alcoholic injection of the labyrinth has its advocates (Mollison 1936, Peacock, 1938, Wright, 1938b), but I have no personal experience of it Surgical division of the eighth nerve limited to its vestibular fibres is practically free from risk and gives excellent results (Crowe 1938)

CO-OPERATION BETWEEN OPHTHALMOLOGIST AND PHYSICIAN IN CERTAIN CASES OF VISUAL LOSS*

BY

C. B. F. TIVY, M.Ch., M.B.

Senior Surgeon Plymouth Royal Eye Infirmary

Under our present system of medical practice the patients who come to an ophthalmologist are by no means ill sent by their family doctor—a good many of them have not even seen him for years, and the first intimation he gets that all is not well with them is a letter from the specialist Others who have seen their own doctor do not always take him fully into their confidence and do not realize that the condition of their eyes has any connexion with their health, and the family doctor himself does not always realize the connexion between the eye condition and the general condition of the patient

It was with these ideas in my head that I suggested that a few remarks on collaboration between the ophthalmologist and the general practitioner, the physician and the neurologist, etc, might be of some value As an example of what often happens I should like to read to you the letters which passed between me and one of my colleagues quite recently

MY DEAR L,—Mrs A came to see me yesterday complaining that her vision seemed to be slightly defective She has worn glasses for some years and has a fair degree of hypermetropia and astigmatism, and the glasses did need some alteration I could not get the vision of either eye up to full normal, the right one being slightly worse than the left There is some slight pallor of both optic discs, especially the right, and moreover, there is some rather vague limitation of the field of vision in the right eye She says that her general health has not been very good, but I could not get any history which would connect up with early optic atrophy

Have you had a Wassermann done? If it is positive that would be a reason The only other suggestion I can make is the possibility of a pituitary tumour, and I must confess that the fields of vision are not at all typical of that

I am sorry to be so vague but I feel that there is something wrong with the woman but that is all I am certain of

Yours sincerely

Types of Cases likely to Benefit

I have to a large extent chosen types of cases that are likely to benefit by treatment which is within the scope of the general practitioner I claim no originality in this paper my object being to suggest and describe briefly some of the types of cases that pass through the hands of the ophthalmic surgeon and of which ultimate treatment lies with the general practitioner the physician or the neurologist I am therefore making no reference to diseases that are wholly or mainly eye diseases although I might really find it hard to say that any such disease is not an affair which has a direct connexion with the general health of the patient

I need not refer at all to injuries of the eyes and only to refractive errors to point out that many cases of apparent sudden failure of vision in one eye can be explained by the existence of amblyopia or a high error of refraction which has remained undiscovered by the patient until some quite irrelevant accident has put the other eye out of action long enough for him to be made dependent on the defective eye Real sudden loss of vision in one eye is sometimes difficult to date accurately for exactly the same reason an example of which I can give by mentioning the case of a young man who came to me with an injury to his right eye from a football Before this he was only vaguely aware that his left eye was not very good but he now discovered that he could not see with it at all I found that he had a large detachment of the retina in his left eye, and on searching his memory he said that he had been struck in that eye by a tennis ball six months before

Apart from injury sudden complete loss of vision in one eye in young people is most commonly due to one of two causes—disseminated sclerosis or vitreous haemorrhage—but some cases of retrobulbar neuritis from other causes may bring about such a rapid deterioration of vision that the loss may be described as sudden and of course large retinal haemorrhages do occur in young people and even embolism of the retinal artery It will be interesting to hear from the physician and the neurologist where we stand with regard to disseminated sclerosis and why it should so often attack the optic nerve or the third fourth and sixth nerves and one would like to know why large vitreous haemorrhages do occur in young people who are apparently otherwise healthy also what is the best line of treatment

In middle aged people sudden failure of vision is most often due to some failure of the vascular system either in the eye itself or in the optic tracts or visual centres If the eye itself is affected this will take the form of retinal haemorrhage of some kind or of embolism of the retinal arteries or thrombosis of the veins

Retinal Haemorrhage

In working class patients failure of vision due to a large retinal haemorrhage or to a thrombosis of one of the retinal veins is very often the first symptom of advanced arteriosclerosis or even of chronic Bright's disease and sometimes of diabetes In case any physician may hereby conclude that I am talking at random I must explain that by 'first symptom' I mean the first thing that the patient complains of to a doctor and the eye doctor is commonly the first to become aware of the patient's grave condition And lest my general practitioner friends should think that I am casting aspersions on them I must go further and say that in my experience the average working class patient (woman especially) will carry on bravely and steadily with all the signs of advanced arteriosclerosis without even thinking of consulting her doctor until some outstanding feature such as loss of vision makes it essential for her to wake up and take notice of herself

When such a patient comes before the attention of the ophthalmologist he can make *his* diagnosis fairly easily because he can see the haemorrhage or haemorrhages and he can observe the tortuous and irregular vessels He can sometimes form a shrewd idea as to whether it is a case of primary arteriosclerosis or one of Bright's disease or diabetes but of course he must pass the patient on to the family doctor or physician for the real investigation and for treatment As to the treatment there is one small point that I should like to lay stress on it is this

Cases of thrombosis of one of the tributaries of the retinal vein should be taken in hand urgently as there is quite a fair chance that a good deal of vision can be restored by measures aimed at lowering the arterial blood pressure and quieting the action of the heart The thrombosis itself is generally situated distal to a spot where the vein is crossed and pressed upon by an artery and the loss of vision is largely due to oedema of the retina as well as to haemorrhages Even if the block in the vein is not relieved or canalized the haemorrhages and oedema do sometimes disappear with rest in bed and treatment—and if this is done early a larger area of retina is saved from destruction

If failure of vision is due to retinal haemorrhages its significance of course varies according to the underlying general condition and it is in diabetes that I think the haemorrhages are of most importance as fresh ones are a certain indication that all is not well The physician who gets a note to say that the fundus condition is getting worse should take this as an indication for reassessment of his patient and especially he should not be reassured by finding that the urine is sugar-free

So far as cases of simple hyperpiesis are concerned I do not think the occurrence of occasional fresh haemorrhages is any valuable indication of the general state of the patient but of course I am open to correction by my physician colleagues and I should be very glad to hear from them why in some cases the retina is seriously affected and in others very little or not at all I have notes of a number of cases where the retinal haemorrhages were numerous and large and the arteries looked very bad but where the patient has kept alive and even enjoyed a fairly active life for many years These cases of loss of vision from simple hyperpieses are not very satisfactory to either the ophthalmologist or the physician because the vision does not often improve much under treatment and the patients are generally of the active type who resent the restrictions put on them when they do not feel really ill It is almost impossible to get them to realize that they are being saved from some major disaster I sometimes wonder if it is worth while to take a woman who is keen on gardening or some man who is busily and fairly happily engaged in some active occupation and force him or her to lead a very quiet life in the hope of prolonging that sort of existence when if left alone he or she might carry on until everything was suddenly ended by a cerebral haemorrhage

By no means all cases of arteriosclerosis show these extreme symptoms and one which might be included under my heading of 'loss of vision' is diplopia caused by a paralysis of the third fourth or sixth nerve Paralysis of the external rectus is by far the most common and I am not at all clear what the exact pathology of this condition is Recovery generally takes place, but

the association of double vision with a report of wiry or tortuous retinal arteries should be regarded by the medical attendant as a well-marked danger sign

In addition to the three great classes of haemorrhagic retinal conditions which I have mentioned, there are, of course various blood diseases in which retinal haemorrhages occur, such as pernicious anaemia, leukaemia, and purpura, but in these cases the loss of vision is very seldom an early feature, and the physician is usually well aware of the disease before the ophthalmologist sees it

Defects in the Fields of Vision

These form a very important item in the matter of liaison between the ophthalmologist and the physician, the neurologist and the surgeon The elderly patient who has had a blockage of his posterior cerebral artery, causing a loss of either the right or left field of vision, will commonly assert that he has lost the vision of one eye, and can only be convinced that that eye still sees when he is made to cover the other and observe objects held at the unaffected side of his field A purely vascular lesion in the occipital region leaves the macula of each eye unaffected owing to the anastomosis or overlapping of the blood supply from the posterior and middle cerebral regions, and the patient can still see to read slowly It is seldom that any improvement takes place in the fields, but the patient does learn to carry his head to one side so as to make better use of his unaffected eye Beyond demonstrating the defect in the field of vision and suggesting that the cerebral arteries are degenerating, the ophthalmologist is of little help

It is in other cases of defects in the field of vision that the eye examination can really be of some help for instance, in a case of middle ear disease with symptoms of abscess in the brain the localization can sometimes be clinched between an abscess in the temporo-sphenoidal region and one in the cerebellum The optic radiations spread out in the temporal lobe on their way from the geniculate body to the occipital cortex and can be interrupted by pressure The hemianopia in cases involving the temporal lobe is not so completely congruous as if the occipital lobe or optic tract is affected because the crossed and uncrossed fibres are not in such close apposition and this incongruity is a valuable localizing sign

Again in suspected tumours of the pituitary the charting of the fields of vision is invaluable The loss of the field of vision may be the first symptom of disease, or it may only be found when the patient is referred by a physician but the alterations in the fields are of first-class importance in estimating the progress or recession of the disease In other tumours of the brain the localization is sometimes greatly helped if not finally determined by examination of the fields of vision

Injury to the Head

I might go on indefinitely mentioning cases where the paths of the ophthalmologist and the physician cross one another or converge

Conclusion

My main idea is to emphasize the fact that loss of vision in the types of case that I have mentioned, and in many others, can be sorted out and diagnosed to some extent by the ophthalmologist and that he can also help in keeping a watch on the progress of the case, but the treatment is almost entirely in the hands of the family doctor, and I hope I have made it clear that loss of vision is generally only one symptom of something with wide reaching consequences to the patient

One does sometimes see the other side of the picture when a patient who is suffering from neurasthenia or even mild mental disorder is found to be developing cataract A successful operation with restoration of easy reading vision will sometimes change the whole outlook on life I have two examples of this in mind

The first case was that of a printer who had got so irritable and nervy that his wife had serious fears that he would do away with himself I found that he had nuclear cataract in both eyes, and after a lot of coaxing he allowed me to operate on one eye This was seven years ago I had a most grateful letter from him last Christmas in which he enclosed a specimen of the minute printing that he was working at, and he has many more happy years of life before him

The other case was that of a country gentleman who had given up his shooting and fishing, had lost all interest in his property, and had become a nervous wreck who spent most of his time drinking at his club He was dragged to see me by a worn out daughter, and both he and she assured me that he could never face an operation I coaxed and bullied him and his doctor doped him with sedatives, and then I operated on him, he nearly broke the hearts of the matron of the nursing home and her nurses He knocked his eye and had a haemorrhage and he did everything possible to ruin his eye but eventually we got him home In due course he sent me a brace of pheasants which he had shot, and he lived for several years a more or less reformed character

I am therefore pleading for a better understanding and collaboration between the general practitioner and the ophthalmologist, so that when the former gets the latter's report he should read it not as something which is to be pigeon holed and only referred to again if the patient complains about some eye symptom, but as a description of the patient's morbid anatomy which has been made by the ophthalmologist in a way that is seldom possible in any other part of the body or by any other method of examination

It may well be, on the other hand that the [illegible] physician feels that he does not always get the information he expects or needs from the ophthalmologist and I hope that some of the other speakers will point out [illegible]

NEW TYPE OF "JACKET" RESPIRATOR FOR THE TREATMENT OF POLIOMYELITIS

BY

AUBRLY F. BURSTALL, D.Sc., M.I.Mech.E.

Professor of Engineering, University of Melbourne

When an epidemic of poliomyelitis in which the nerves of the respiratory muscles were severely attacked occurred in Victoria in 1937 I was called upon to assist in the local manufacture of respirators which were required quickly and in large numbers. At the beginning of the outbreak, in May, there were two cabinet type respirators in Victoria—one at the Queen's Memorial Hospital for Infectious Diseases at Fairfield, manufactured by the Drinker Company, and the other at the Children's Hospital, Melbourne, built by the Acme Vacuum Cleaner Company with the collaboration of a hospital at Toronto. The latter respirator was purchased in Canada for the Children's Hospital by Dame Jean Macnamara in 1935 with a view to its being reproduced if an epidemic made it necessary.

FIG. 1.—Jacket respirator being fitted.

A modified pulsator valve was devised, the centrifugal fan and valve being used in preference to the Drinker arrangement. By this means it is possible to couple up a large number of respirators to one mechanically operated unit. The usual number was six respirators of the cabinet type connected to one fan and pulsator unit. Thirty-five of these pulsator units to operate nearly 200 cabinets, were constructed in Victoria in 1937 for use all over Australia.

The epidemic was almost over before it occurred to me that a simplified type of respirator, in which only the chest was included, might be equally effective and would certainly have many advantages over the cabinet type, particularly in nursing and for splinting the arms. This simpler type, termed the jacket respirator, was built at Christmas 1937 in the Engineering Laboratory of the University of Melbourne and was demonstrated to a number of medical practitioners on January 27, 1938. A week later one of these jacket respirators was put into use at the Children's Hospital, Melbourne, and at the time of writing (August, 1938) it has been in use continuously ever since. Some weeks later a similar apparatus was built for and used in the Queen's Hospital for Infectious Diseases at Fairfield, and others have been supplied to hospitals in Victoria and South Australia. One has also been supplied to Dr. Andrew Topping of the London County Council, at whose suggestion the present paper has been prepared. It was thought that a description would be of interest to members of the medical profession (see Figs. 1, 2, 3).

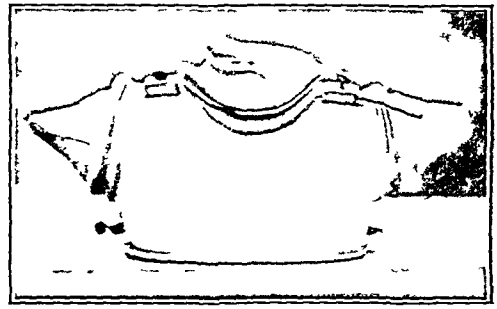

FIG. 2.—Jacket respirator, back view, showing metal lugs.

FIG. 3.—Jacket respirator on patient and attached to pulsating mechanism.

Description of the Apparatus

The apparatus consists of an aluminium cuirass made in one piece which is hammered out to the shape of the thorax. It encloses the trunk of the patient from the

neck down to the waist-line, and is connected to the pulsating mechanism by means of a one-inch flexible hose. It can be connected to a cabinet type respirator. The capacity of a cuirass is so small that a large number of them may be operated from one cabinet type respirator by drilling a hole in the cabinet and connecting a hose to it. Inside the cuirass is a sponge rubber vest, one inch thick, with holes for the arms, neck, and waist. The openings in the cuirass have a beaded edge and are closed to the body by soft sheet rubber jointing pieces, which are held to the cuirass by being lifted over the beaded edge. This resembles somewhat the method by which a glass jam-jar is covered with a parchment lid. Rubber rings may also be added to prevent the sheet from working off the beaded edge. The cuirass is provided with four metal lugs for the attachment of the arm splints as shown in the illustration. The whole of the metalwork can be sterilized. It weighs only 6 lb. for a patient aged 10. It is thought that three sizes of cuirass will provide for patients ranging from the age of 3 years up to medium-sized adults.

For the legs and trunk the modified double Thomas splint frame (Macnamara, 1932), minus the arm supports, is fitted to the patient, the upper portion going up inside the aluminium cuirass and the waist-joint being made over the two longitudinal members of the frame.

The time taken for two persons to dress a sick patient completely in the new respirator is seven minutes without splints and ten to twelve minutes with splints. This respirator is therefore not as suitable for the treatment of emergency cases as the Drinker type, because more joints have to be made, and there is more delay in getting the patient into the respirator.

Merits and Demerits

I wish to emphasize that from the outset it was never contemplated that this apparatus would entirely replace the cabinet type of respirator in a large hospital. The jacket respirator was primarily designed to provide cheaper and better facilities for the treatment of patients who had recovered from the acute stages of the disease.

The special features which characterize this respirator as it was first made are as follows:

1. The main portion is constructed of aluminium.
2. The metal is welded up to form a single piece.
3. The aluminium is hammered out to the shape of the
8. The air capacity is much less.
9. It is easier to maintain the temperature of the extremities.
10. It is particularly valuable when the deltoid muscles are paralysed.

Experience with the jacket respirators which have been used up to the present reveals the following disadvantages:

1. The time taken to install the patient in the respirator is longer than in the cabinet type.
2. At least three sizes of respirator are required.
3. To raise the arms over the head may cause the patient some distress, and in certain cases may make it impossible for this respirator to be used.
4. There are more points where leakages may occur, and more rubber joints to maintain.

Since this type of respirator was constructed discussion has arisen regarding the advisability of including the diaphragm within the respirator, and the jacket at Fairfield Hospital has been extended to include the diaphragm. This modification has not affected the ease with which the patient can be placed in the respirator, but it has increased the difficulty of attending to the patient's back.

The jacket respirator has other applications—for example, it seems to be suitable for the resuscitation of the apparently drowned. The small air capacity makes it possible for a light hand operated bellows to be used in conjunction with the respirator. Further experiments towards its development and application for this and other purposes are contemplated.

I wish to record my indebtedness to numerous members of the medical profession in Melbourne for their advice and assistance during the experimental stages of this work, and particularly to Dame Jean Macnamara for her advice and encouragement to make the first jacket respirator; to Dr. V. L. Collins, medical superintendent of the Children's Hospital, Melbourne, who so willingly undertook to give it a trial; to Dr. F. V. Scholes, medical superintendent of the Queen's Hospital for Infectious Diseases, Fairfield, Victoria, and his staff, and to Dr. F. Kingsley Norris for his advice and enthusiasm.

The jacket respirators were constructed in the workshops of the engineering department at the University of Melbourne by Mr. D. Campbell, under my supervision.

THE DIAGNOSIS OF WHOOPING-COUGH

BY

A. B. DONALD, M.D., D.P.H.

Senior Assistant Medical Officer City Hospital Edinburgh formerly Assistant Medical Officer L.C.C. Special Hospitals London

(From the North Western Hospital Lawn Road and Group Laboratory Pond Street London N.W.3)

The clinical diagnosis of whooping cough in its earliest stage—when recognition would be most valuable in preventing spread of infection—is very difficult and in the majority of cases quite impossible. Even in its later stages diagnosis is far from simple—for example in a series of 171 cases sent to hospital as whooping cough thirty five or 26 per cent were wrongly diagnosed while thirty-eight out of 136 cases or 28 per cent bacteriologically confirmed as whooping cough had not been heard to whoop before admission and never whooped while in hospital. In view of this difficulty in clinical diagnosis an effort has been made to assess the value of various laboratory methods of diagnosis. These may be divided into (1) specific tests—namely (*a*) the isolation of *H. pertussis* by the cough plate method (*b*) the demonstration of specific antibodies by complement fixation or agglutination (*c*) the intradermal sensitivity test and (2) non specific tests—namely (*d*) total and differential leucocyte counts and (*e*) the erythrocyte sedimentation rate. The specific tests mentioned depend on the assumption that *H. pertussis* is the aetiological agent the arguments in favour of which have recently been reviewed by Gardner (1936).

Cough plate Method of Diagnosis

This is the only certain method of early diagnosis and as there are several pitfalls in the technique of preparation of media and exposure of plates the methods are fully described.

THE CULTURE MEDIUM

Potatoes are cleaned and cut into thin slices 250 grammes of which are added to 500 ml. of tap water and 9 grammes of sodium chloride. The mixture is boiled until the potatoes are soft whereupon the loss of water in boiling is made up the whole filtered through linen and the reaction of the filtrate adjusted to *p*H 7·6. 60 grammes of agar powder (B.D.H.) are added to 1,600 ml. of tap water and dissolved. This gives a final concentration of 3 per cent. agar in the medium. To the dissolved agar solution are added 200 ml. of the potato extract 20 ml. of glycerin and 1 per cent. proteose peptone (difco) after mixing distribute in flasks in 100 ml. amounts which are autoclaved. The medium is stored in the cold room till required.

Finally a flask of the glycerin potato agar medium is placed in the steamer for one hour after which it is gently inverted several times and put in a water bath at 55° C. for five minutes until the agar has a temperature of approximately 70° C. An equal volume of defibrinated horse blood is put in the water bath at 55° C. for two to three minutes to take the chill off. The blood is added to the glycerin potato agar mixed very gently to prevent the formation of bubbles and the mixture is poured into Petri dishes. The plates which should not be dried in the incubator are stored in the cold room and may be used for a period of two weeks. It is most important that the surface of the medium be perfectly smooth and free from pitting which by reflecting the light gives a passable resemblance to colonies of *H. pertussis*.

This medium is similar to that used by Westwater and Straker (1937) but differs from that of Gardner and Leslie (1932) as it contains 50 per cent. instead of 33 per cent. blood. Plates of this medium when compared with those containing only 20 per cent. blood gave greater numbers of more easily identifiable colonies.

TECHNIQUE OF EXPOSURE OF PLATES

At the start of the series all cough plates were taken by the ward sisters but later any of the nursing staff including probationer nurses exposed the plates and very few were spoiled. Two plates were exposed in every case so that a heavy and a light inoculum could be obtained from each and quite frequently it was found that one plate was positive and the other negative. Either a natural or an induced spasm of coughing may be used the latter by tickling the front of the neck over the larynx giving the patient a drink of cold water or as was done in most cases inserting a spatula into the pharynx. Once the paroxysm was started the plate was held about four inches from the mouth and exposed for a number of expiratory barks which varied from fifteen to twenty in a very young infant to four to eight in children aged 2 to 5 years. It is impossible to state any definite number of barks required as the force of the bark varies greatly and some experience by the person exposing the plate is very helpful. Young children should preferably be lying down and older children sitting up. If the spasms are short the plate may be exposed on several occasions. Before exposure the surface of the medium should be quite dry as any condensation moisture may help to spread contaminant growths.

After exposure the plates were incubated at 37° C. In a number of instances they were left lying in the ward for twenty four hours after exposure and others were kept in the ice chest for the same period but subsequent incubation showed that these procedures did not in any way delay or inhibit the growth of *H. pertussis*.

EXAMINATION OF PLATES

The plates were examined as a general rule after seventy two hours incubation but in many instances the pertussis colony could be identified in forty eight hours. The ease with which this was done depended almost entirely on a very smooth surface to the medium. Practically all plates were discarded after three days incubation since a plate negative on the third day was never found to be positive on the fourth. In no instance did spreading colonies need to be cut out of the medium as recommended by Gardner and Leslie (1932).

The colonial and morphological appearances of the organism conformed to the descriptions given by many workers. Daylight was preferred to artificial light and the use of a lens was found very helpful in looking for colonies. Haemolysis did not appear in the medium at seventy two hours but when plates were stored for a day or two longer in the ice chest a zone of clearing was often observed. Of the other colonial appearances which may be confused with pertussis that of *H. influenzae* is most important. The latter was flatter duller in oblique light slightly transparent and occasionally of a yellowish colour.

Subculture.—At least two colonies suspected as being *H. pertussis* were subcultured on the Bordet medium, and after twenty four hours incubation the typical growth with a grey sheen like that of aluminium paint was seen. *H. pertussis* in a Gram stained smear of the culture appears as a small Gram negative cocco bacillus uniform in size occurring in clumps and giving the impression of a thumb print. Occasionally the bacilli appear in paired forms but very seldom in chains.

Agglutination—Final identification was carried out by performing "slide agglutination" with a thick suspension of the subculture, and this was further verified by agglutination by Dreyer's method

RESULTS

All cases in the series were diagnosed as whooping-cough on bacteriological, clinical, or serological grounds The results in 136 cases, many of which were examined by the cough-plate method on several occasions, are shown in Table I

TABLE I—*Isolation of H pertussis from 136 Cases of Whooping Cough*

	No of Tests	Positive	Per cent Positive
1st week	5	5	100
2nd	31	29	93 5
3rd ,	58	55	94 8
4th	75	33	44
5th ,	113	8	7 1
6th ,	120	1	0 8
7th	128	1	0 7
Total	530	132	

The duration of disease was definitely ascertained in almost all cases by personal interview with relatives, and the date of the first cough was taken as the beginning of the illness The small number of cases examined in the first week is due to the fact that parents do not consult the doctor until the paroxysmal stage has been reached One case which gave positive plates in both the tenth and eleventh weeks is not included in the table These findings are comparable with those recently published by Westwater and Straker (1937), who obtained positive plates in 86 5 per cent of cases in the first week, 84 4 per cent in the second 70 6 per cent in the third, and 50 per cent in the fourth

EFFECT OF BRONCHOPNEUMONIA ON EXPECTORATION OF THE BACILLUS

In the series there were sixteen cases of bronchopneumonia From eleven of these positive cough-plates were obtained, and all were in the third week of illness except two, which were admitted during the fourth and fifth weeks As the remaining five cases were all admitted after the third week of the illness it would appear that bronchopneumonia does not affect the expectoration of the bacillus Of these sixteen patients four died, all having given positive cough-plates, and at necropsy in three of them large numbers of *H pertussis* were cultured from the lungs, trachea, and bronchi, no examination was performed in the remaining case

DEGREE OF POSITIVITY OF COUGH PLATES

It was found that of 134 positive plates obtained at various stages of the illness ninety-six, or 71 6 per cent, had an estimated *H pertussis* colony count of ten or less This shows the need for careful scrutiny of each plate, especially if it has been over-exposed

ATYPICAL COLONY APPEARANCE

In the majority of cases positive plates gave typical colony appearances, but five children were found to be exceptions Four of these were infected by an unsuspected case of whooping-cough which had been admitted to a scarlet fever ward All gave much larger colonies, whiter than normal, and not so glistening as typical *H pertussis* colonies Subcultures from these colonies gave a luxuriant growth, less glistening than usual, and failed to show the typical aluminium-paint appearance No explanation has been found for this atypical colony

RELEASE PLATES

Although more attention has been paid to the cough plate as a diagnostic method, it follows that it may have value as indicating the cessation of infectivity As the certainty with which the bacillus can be recognized increases the duration of stay in acute fever hospitals could be greatly cut down in cases where further convalescence could be carried out at home or in a convalescent institution if the patient were shown to be non-infective

CARRIERS

The question of carriers of *H pertussis* has for long attracted the attention of public health workers In the present series 110 cases were examined on the day of discharge or shortly before, and in no instance was a carrier found, two plates being taken from each case One case in particular may be mentioned A boy of 8 years was admitted with mild faucial diphtheria at least ten weeks after the start of a mild but definite clinical attack of whooping-cough, and this history was supported by serological findings, his complement-fixation test being strongly positive (— + —) While in hospital he had a very occasional slightly spasmodic cough, and, as a matter of interest, cough-plates were taken, and two colonies of *H pertussis* were isolated and subcultures agglutinated to the maximum titre of the known serum A week later a plate with one colony was obtained, but in the twelfth and subsequent weeks there were no further positive plates No cross-infection was present in the ward, in which there had been one week's exposure, and the suggestion was put forward that *H pertussis* isolated from late cases might possibly be avirulent To test this, virulence tests were made by Dr J C Cruickshank at the London School of Hygiene on several strains of *H pertussis* isolated in the fifth, sixth, and seventh weeks of infection as well as in the early stages These were carried out by injecting mice intraperitoneally and noting the day of death No relation was noted between the degree of virulence of the organism and the severity or duration of the illness in the patient

Complement-fixation Tests

This diagnostic procedure is of very little value as a means of early diagnosis, as the test does not become positive until the third or fourth week or later It may, however, be employed to establish the diagnosis in late or atypical cases, when the period of expectoration of the bacillus is past In hospital practice it has a practical value, too in ascertaining whether a child with a cough of long standing, suspected of being whooping cough, should be admitted to a whooping cough ward or not In this series the test was carried out bi-weekly in 123 cases of whooping-cough

Technique of Test—This was performed in a manner similar to the gonococcal complement-fixation test using a virulent strain of *H pertussis* as antigen (2,000 million organisms per ml), and 2, 3, and 5 M H D of complement Sera fixing less than 2 M H D were recorded as negative

In the series of cases under review all except four patients diagnosed as having whooping cough on bacteriological and clinical grounds (including haematological examination) showed a change from a negative to a positive complement fixation reaction or if already positive on admission became more strongly so while in hospital Three of the exceptions were aged 3 weeks 4 months and 3 years and although all had typical attacks of whooping cough and gave positive cough plates none showed antibody in their sera although they were examined repeatedly until the tenth week The fourth patient aged 7 months died of bronchopneumonia during the sixth week of illness and fixation tests were repeatedly negative but as several other cases of bronchopneumonia showed delay in the appearance of antibodies until the sixth week or even later this result is inconclusive At necropsy a heavy growth of *H pertussis* was obtained from the lungs and trachea All four cases had typical leucocytosis with lymphocytosis

RESULTS OF COMPLEMENT FIXATION TESTS IN 123 CASES OF WHOOPING COUGH

In 123 cases of whooping cough 383 complement-fixation tests were carried out at various periods the result being shown here in graph form (Chart 1)

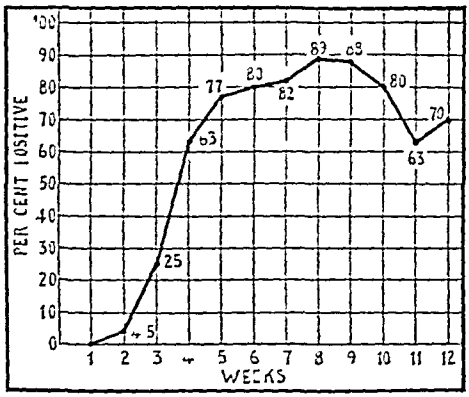

CHART 1

It is seen from the chart that the reaction becomes positive at approximately the third week, and increases steadily till at the seventh and eighth weeks the great majority of cases give positive results after which it falls off slowly In general as in other infections the antibodies tend to disappear after the acute phase of the disease but they may persist in low titre for a considerable time or be stimulated to reappear by another infection as will be shown later

These results may be compared with those of Chievitz and Meyer (1916) who found that 25 per cent of 259 cases tested gave positive results in the second week and that during the fifth sixth and seventh weeks all cases examined gave positive reactions (100 per cent) with a gradual fall to 89 per cent at the twelfth week This relatively high incidence of positive reactions early in the disease may be due to the fact that in many cases they did not inactivate the serum which they found gave a definite positive when inactivated serum gave only a feebly positive reaction

DEGREE OF POSITIVITY

The above graph (Chart 1) however gives no indication of the degree of positivity and an effort is made below (Table III) to do this In Table II the method of reading results of the tests is shown

TABLE II

	M H D			Serum Control 2	Result
	2	3	5		
Degree of haemolysis	C	C	C	C	Negative
	Tr	C	C	C	Doubtful =

It will be noted that out of seventeen cases fixing 3 M H D of complement (– – –) fourteen were between the sixth and eleventh weeks the remaining three occurring in the fourteenth and fifteenth weeks (two of these from the same case) while of eighty eight cases fixing 3 M H D of complement seventy nine did so between the fifth and eleventh weeks so that it would appear that the peak of antibody formation occurs at approximately the seventh to eighth week which is a result closely allied to the curve of appearance of the antibodies It may therefore be claimed that if one wishes to verify the diagnosis in a doubtful or atypical case of whooping cough serum should be tested at this period to obtain the most certain proof of recent infection

Does a Positive Complement fixation Test indicate a Recent Attack of Whooping-cough ?

While carrying out this investigation it was observed that eighteen cases which had given a positive complement fixation reaction eventually became negative and it was thought that the fixation test might be found to be absolutely specific for the acute stage of whooping cough To verify this a series of tests were carried out on patients who had a previous history of whooping cough These patients were for the most part cases of scarlet fever and diphtheria some acute others convalescent and at all ages from 2 to 30 years The results obtained were as follows of eighty eight cases examined sixty six gave positive complement fixation tests but of these only four fixed 3 M H D (– – –) the remainder (sixty two) only fixing 2 M H D of complement It may be that the febrile period through which these patients passed stimulated the reappearance of antibodies but pyrexia could not be held responsible as several with positive results had very little elevation of temperature while others with a marked degree of pyrexia gave negative results In this series also the parents were not interviewed except in a few cases and it is possible that the histories of whooping cough (given to nurses) were in some instances inaccurate In five cases with a history of whooping cough a year or less previously three gave negative and two positive complement fixation reactions On the other hand all the four cases giving – – comple-

ment-fixation reactions (3 M H D) had had whooping-cough at least three years previously

Gardner (1936) in a recent publication states that, "like all specific antibodies, however, their presence only proves that the subject has recently been under the stimulus of the specific antigen, not that he is suffering from the present infection,' and in 1934 Bennholdt-Thomsen claimed that adults in contact with whooping-cough acquired a strongly positive complement-fixation reaction without showing any clinical symptoms He found that eight persons with a negative or feebly positive complement-fixation reaction were strongly positive after being in contact with cases of whooping-cough for periods varying from fourteen to seventy-four days An attempt was made to verify this during the present study, but without success Of fourteen persons tested before commencing work in the whooping-cough wards only two gave positive fixation reactions When tested again after periods of contact varying from thirty-one to 120 days only two showed any change One, previously negative, became weakly positive after forty-two days contact, and the other changed from weak positive to positive after eighty-five days' contact In addition to these results it was found that my own blood was negative after nine months contact, and when examined after twelve months gave a doubtful positive (±) reaction, while a sister in charge of a whooping-cough ward for sixteen months failed to show any antibody after this period This short series helps to establish the specificity of the test

EFFECTS OF BRONCHOPNEUMONIA AND AGE ON COMPLEMENT-FIXATION TESTS

It has been pointed out by Paton (1937) that negative complement-fixation reactions were found in cases with severe attacks of whooping-cough or where there were complications such as bronchopneumonia, but in most of his cases the blood was tested only once In this series twelve cases of bronchopneumonia were tested at intervals, and on an average the reaction was found to become positive at the sixth week, which indicates delay in the appearance of the antibodies but as one of the cases in question did not give a positive result until the twelfth week, the average time of appearance of antibodies in the remaining eleven would be the fifth week Of three cases

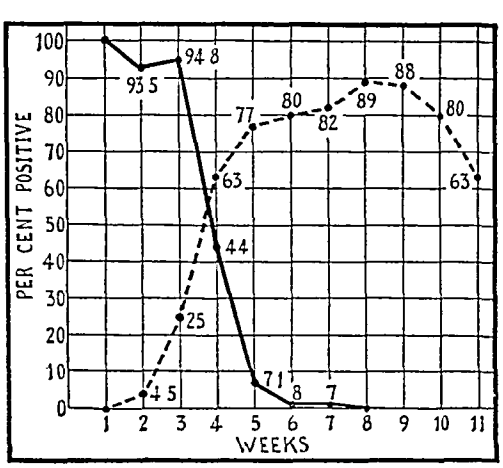

CHART 2.—The continuous line represents cough plates and the broken line complement fixation tests

of bronchopneumonia that ended fatally all gave negative reactions at the seventh week (aged 3 months), third week, and second week respectively

Age in the present series appeared to have little effect, except in one child aged 1 month and in another aged 4 months, both of whom failed to give positive complement-fixation reactions at any stage, but in contrast to this seven other children, all aged 3 to 4 months, gave positive complement-fixation reactions, although the appearance of antibodies was slightly delayed Only two of these gave ++ complement-fixation reactions (3 M H D), the remaining five sera fixing only 2 M H D Sauer (1934) mentions the difficulty in immunizing very young children, and other workers have experienced difficulty in demonstrating antibodies in infants

The accompanying graph (Chart 2) shows how the antibodies appear as the expectoration of bacilli ceases

Agglutinins in the Blood

Fifty different sera, most of which gave well marked complement-fixation reactions, were tested for agglutinins, and the conclusion come to was that the agglutination test was unreliable and useless as a method of diagnosis

Skin Tests

A series of fifty-eight cases were tested by the intradermal injection of 0 1 ml of a killed suspension of *H pertussis* (2,000 millions per ml), but results were equivocal, and this method was abandoned

Non-specific Tests

BLOOD COUNTS

There is considerable controversy in the literature regarding the value of white cell and differential blood counts as an aid to the early diagnosis of whooping cough

In the present study 118 patients were examined White cell and differential blood counts of all cases were done on admission, and in several instances were repeated before discharge The normal standard for children employed was that of Still (1927) (Table IV), most of the counts being done at a relatively late stage of the illness, usually after the second week

TABLE IV

	Birth	6 months	2 years	5 years	10 years
Total leucocytes	24 000 to 62 000 per c mm	15 000 per c mm	13 000 per c mm	11 000 per c mm	9 000 per c.mm
Polymorphonuclears	78 to 80 %	35 %	40%	55 %	60 %
Lymphocytes	20 to 22 %	57 %	52 %	37%	32 %

One case only was examined during the first week of illness, a girl of 5½ years whose count showed 10,600 leucocytes per c mm, with a differential count of 55 per cent polymorphs and 37 per cent lymphocytes, which may be regarded as normal During the second week sixteen cases were examined, and all, except two with leucopenia, showed a definite leucocytosis, with a relative and absolute lymphocytosis

The highest counts with lymphocytosis predominant were obtained in the third and fourth weeks The average white cell and differential counts at three age groups are shown (Table V) for this period of illness (third and fourth weeks)

A control series of thirty-two cases of bronchitis, mainly of a mild nature, were examined, the majority of the cases being in the age group 2–5 years (Table V)

TABLE V

	Age	Leucocytes	Polymorphs	Lymphocytes	No. of cases
Whooping cough	0–5 yrs.	30 000 per c.mm.	35	65	28
	5–	31 000 „	29	66	53
	5+	30 000 „	34	63	12
Bronchitis	5– „	15 000 „	59	3	32

From these figures it will be seen that at all age groups in children the average leucocyte count during the third and fourth weeks of whooping cough is 30 000 per c.mm. while the differential count shows a well marked lymphocytosis in each age group. It will be noted that the series of controls also shows a very mild degree of lymphocytosis but the total white cell count is approximately only half that found in the cases of whooping cough. Only four cases under 6 months of age were examined and in contrast to the findings of Begg and Coveney (1935) all showed marked lymphocytosis but only a mild degree of leucocytosis.

From this peak at the third and fourth weeks the fall to normal was found to be very gradual. The total leucocyte count was the first to change and in the majority of cases of uncomplicated whooping cough had returned to normal at approximately the sixth or seventh week, but the relative lymphocytosis persisted for a longer period and in 50 per cent. of cases examined was still present during the ninth and tenth weeks.

Erythrocyte Sedimentation Rate

This test was carried out in ninety-five cases of uncomplicated whooping cough employing the Westergren method. The results showed a retardation of the sedimentation rate in the second and third weeks with a slight acceleration in the later stages. Since however 29 per cent. of twenty-four cases of acute bronchitis also showed a retardation of the erythrocyte sedimentation rate the test would appear to be of little value by itself but as suggested by Gold and Bell (1936) when used in conjunction with total and differential leucocyte counts in cases with a suspicious cough the test is of definite value.

Practical Application of the Various Diagnostic Methods

The cough plate has been demonstrated to be the only sure method of establishing the diagnosis at the onset and the figures show that whooping cough may be *diagnosed with certainty in over 94 per cent. of cases during the first three weeks of the disease*. By this method the abortive case can be recognized and isolated thus removing an important factor in the dissemination of infection. The negative cough plate also plays an important part in deciding when a child is free of infection and it may render great service to the administrator of a hospital institution or boarding school. In the cough plate the practitioner has at hand a means by which to diagnose and thus control the spread of disease in the home and a method of determining when isolation should cease. The difficulties of this method of diagnosis should not present a serious obstacle to its more general use. Any modern bacteriological laboratory could prepare a suitable medium in a suitable container. The use of the aluminium plate is to be recommended for institutions etc. where carriage or postage is necessary. The time required for diagnosis (three days) will probably be shortened as improvements in media are devised and in any case it is no longer than is usually necessary for the isolation of the typhoid bacillus from faeces. If the time and attention given to devising methods and media for the isolation of the latter organism during the past twenty years were now transferred to the problem of the isolation of *H. pertussis* it is probable that the bacteriological diagnosis of whooping cough would soon become a simple routine procedure.

The complement fixation test has definite limitations and is of no value in diagnosis at the time when it would be most useful—that is in the early stages of infection. Its main value lies in corroborating the diagnosis of abortive or atypical cases where the test may be found to have changed from negative to positive or if already positive to become increasingly so reaching a maximum degree of positivity at the seventh to eighth week. A strongly positive complement fixation reaction at this period is almost conclusive evidence of recent infection with *H. pertussis*.

When bacteriological facilities are not available the total and differential leucocyte count is valuable in cases where there is a *suspicious cough* as it has been shown that a leucocytosis and lymphocytosis is an almost constant finding from the second week of the disease until almost the end of the stage of decline. This method has definite value, and could be employed in dispensaries and out-patient departments of general hospitals and would be extremely helpful in diagnosis.

Summary

An attempt has been made to assess the value of the various methods available for the early diagnosis of whooping-cough. The methods are: (1) *Specific tests*—(*a*) cough plate method, (*b*) complement fixation tests, (*c*) intradermal tests. (2) *Non specific tests*—(*d*) total and differential leucocyte counts, (*e*) erythrocyte sedimentation rate.

SPECIFIC TESTS

(*a*) *The cough plate method* is the only means of certain diagnosis in the earliest stages of the disease. In a series of 136 cases at all stages 100 per cent. were found to give positive plates in the first week, 93·5 per cent. in the second week, 94·8 per cent. in the third week, and 44 per cent. in the fourth week, after which there is a rapid fall to 7·1 per cent. in the fifth week and less than 1 per cent. in subsequent weeks. The value of the cough plate in the diagnosis of atypical and abortive cases is stressed and its value to public health administrators mentioned. Emphasis is also laid on the negative cough plate as a criterion of the termination of infectivity.

(*b*) *The complement fixation test* is shown to be of little value except as a means of corroboration of the diagnosis and occasionally as an indication of immunity. In a series of 123 cases the reaction was found to become positive in 25 per cent. during the third week of illness and reached a maximum during the eighth week when 89 per cent. of the cases gave positive fixation reactions.

(*c*) *The intradermal test* using a suspension of *H. pertussis* is found to be valueless in diagnosis or as a method of determining susceptibility or immunity.

NON SPECIFIC TESTS

(*d*) *The total and differential leucocyte count* is found to be valuable from the second week onwards almost all cases examined showing marked leucocytosis and both absolute and relative lymphocytosis. During the third and fourth weeks the leucocyte count averaged 30 000 per

c mm, with a differential count showing 65 per cent lymphocytes and 28 per cent polymorphonuclears

(e) *The erythrocyte sedimentation rate* is shown to be slightly retarded or normal in almost all uncomplicated cases of whooping-cough in the early stages, with a slight increase in the later stages of the illness

I wish to thank Dr A Joe medical superintendent of the Edinburgh City Hospital formerly of the North Western Hospital for his advice and helpful criticism Dr R Cruickshank pathologist Group Laboratory, North-Western Hospital for his constant supervision and advice on the bacteriological and immunological work carried out in the group laboratory and also the members of the laboratory staff for their assistance

HUMAN OIL IN THE TREATMENT OF ADHERENT SCARS

BY

CECIL P G WAKELEY, D Sc, F R C S, F A C S, F R A C S (Hon)

Senior Surgeon Kings College Hospital and West End Hospital for Nervous Diseases

Adherent scars are always a problem, and especially so when adherent to bone or cartilage Some five years ago, when confronted with two cases of extensive adherent scars in the neck due to *x*-ray treatment given for exophthalmic goitre, I first tried the experiment of using human oil In these cases the attenuated and parchment-like skin of the neck was adherent to the cartilages of the larynx and the trachea All the subcutaneous tissue of the neck and the infrahyoid muscles had disappeared, and there was absolutely no independent movement of the skin over the trachea and laryngeal cartilages These patients were in a miserable condition and had travelled over the Continent and visited numerous clinics in search of relief for their sufferings As may be imagined, swallowing was difficult and painful, as the skin and the trachea were densely adherent The only form of treatment appeared to be the introduction of some substance between the adherent skin and the trachea, cricoid, and thyroid cartilages Excision was out of the question, and *x*-ray treatment could not cure a condition it had produced I experimented with various types of oil, including different grades of paraffin but none of these gave satisfactory results and all were very painful

Knowing that human fat was fluid at body temperature —for if an incision is made into the abdominal wall one can see the fat globules when some of the fine trabeculae which hold them imprisoned are cut through—some fat from the omentum was removed at laparotomy and investigated, and it gave good results

Preparation of the Oil

My colleague, Dr Creed, assisted me greatly in the isolation and sterilization of the human oil The procedure we adopt is as follows A portion of omentum is removed from a person who is undergoing an operation such as the removal of the appendix or gall bladder The excised portion of omentum is placed in a sterile vessel and taken to Dr Creed's pathological laboratory It is thoroughly washed with distilled water to free it as completely as possible from serum and blood, and then placed in a specimen jar half filled with distilled water and plugged with cotton-wool This is heated to 120 C in the autoclave for half an hour After this treatment most of the fat will be found floating free on the surface of the water as a clear yellow oil While still warm it is pipetted off with a sterile capillary pipette and distributed into sterile 1 c cm ampoules A little is also inoculated into broth culture medium to check its sterility Each ampoule, after sealing, is placed in a short wide test tube, which is plugged with wool and sterilized in the autoclave The ampoules are kept in these plugged tubes so that their exterior remains sterile and can be safely handled by the surgeon

Technique of Treatment

The human oil is liquid at body temperature but is quite solid at temperatures below that, as can be seen in Fig 1 The tube on the right contains solid human oil, but that on the left has been heated to body temperature and is fluid of a clear amber colour The oil is put up in 1 c cm ampoules, as it is never safe to inject a larger quantity at one time The ampoule is warmed in water until the oil is slightly above body temperature, the neck of the ampoule is then broken off and the oil drawn up into a warmed 5 c cm Record syringe The reason for using a 5 c cm syringe instead of a 2 c cm one is that more pressure can be exerted when the injection is given, and this is a most important point When the oil is in the syringe the scar tissue is carefully cleaned with spirit, and a site is selected just at the outer border of the scar tissue and the syringe insinuated between the adherent bone and the contracted and adherent skin (Fig 2) The oil is forced in between these two structures, not more than 1 c cm being injected at any one place The scar tissue is actually raised off the adherent bone or cartilage Several different areas can be injected at one sitting, and the patient does not experience any more pain than is produced when an intramuscular injection is given About twenty-four hours after the injection the site becomes somewhat red and hot, this condition persists for about twelve to twenty-four hours and then gradually disappears Injections can be given at fortnightly intervals and by degrees the adherent scar is made to float upon the underlying structure In the case of badly adherent scars due to *x* ray burns, as many as twenty to twenty-five injections may sometimes be required It is very important that the injections should not be too frequent and that not more than 15 c cm

FIG 1—Solid human oil in the right hand ampoule liquid human oil in the left hand ampoule

be injected in any one area or the scar tissue will give way and an ulcer will form which may take a long time to heal

Besides cases where the scar is adherent to bone or cartilage which are ideal for this form of treatment there are others in which extensive adhesions have formed between tendons and their tendon sheaths or to skin itself as on the posterior surface of the hand In such cases the injection of the oil often results in the free movement of the tendon Here again it is important that not more than 1 c.cm. of the oil be injected at a sitting

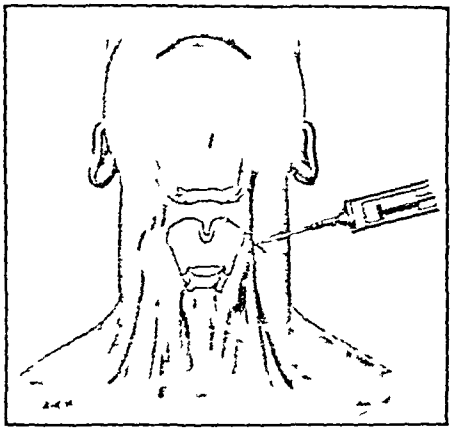

FIG 2.—Method of injecting human oil under an adherent scar

FIG 3.—Showing an adherent scar on the face

or the thinned skin will give way also at least two weeks should elapse before a second injection is given Twelve cases of adherent scars at the back of the hand have been treated by this method and have given uniformly good results It is also valuable in many cases of burns of the face in which the scar is adherent to bone Fig 3 shows a child that was terribly burned on the right side of the face resulting in a long adherent scar the whole length of the mandible on the right side Twelve small injections of human oil resulted in a mobile scar which is gradually becoming more supple and less distinct

In some cases of healed varicose ulcer of the leg where the skin is densely adherent to the tibia a mobile scar can be obtained by this method

The advantages of this form of treatment are that the subject can be treated as an out patient and there is no incapacitation and it often renders extensive plastic operations unnecessary

Clinical Memoranda

Acute Volvulus of the Stomach

Since Laewen in 1927 summarized forty known cases of volvulus of the stomach very few additional cases have been recorded In a review of the literature the aetiological factors in the causation of volvulus of the stomach appear to be (1) ptosis of the stomach with laxity of its ligaments causing increase in the normal space beneath the diaphragm, associated with excessive peristalsis (2) congenital weakness of the left side of the diaphragm The following case is interesting because it reveals the possibility of perigastritis as a cause of gastric volvulus

CASE RECORD

A man aged 25 was admitted into the Anlaby Road Hospital Hull complaining of severe pain across the upper abdomen and across the back at the lower dorsal and upper lumbar level The pain had begun suddenly at 1 p.m. on the day of admission and had persisted with such intensity that by 8 p.m. on the same day he was begging to be put out of his misery He was a spare man of sallow complexion with peculiar slit like eyes and a non paralytic left external divergent strabismus He had been born with bad eyes and double inguinal hernia for which he had had two operations He had not walked until 6 years of age nor cut a tooth until two years later and because of his backwardness was not accepted as a regular scholar at the council school until 8 years old On leaving school at 14 he had difficulty in finding employment because of his mental condition His mother and father are both alive and healthy and he has three brothers and four sisters all alive and well

Clinical Signs.—On examination there was a patch of herpes on his lower lip and a mucous polypus presenting at the right nostril The upper third of his abdomen was somewhat distended but the lower two thirds were quite normal and flaccid His heart chest and central nervous system were also normal Rectal examination revealed nothing abnormal His pulse rate was 80 temperature 97 and respirations 36 He was given morphine ¼ grain The following morning after a restless night he still complained of the agonizing pain His upper abdomen was very much ballooned and now appeared to have definite contour It bulged from beneath the eighth rib in the left anterior axillary line to the eighth rib in the right nipple line and descended from these two sites in a parabola to two fingerbreadths below the umbilicus The patient had not vomited but had regurgitated whatever fluid he had attempted to take There were no abnormal physical signs in the chest The swelling was assumed to be due to a distended stomach An attempt was made under chloroform anaesthesia to pass a stomach tube but it was found impossible to get it into the stomach A differential diagnosis of acute volvulus of the stomach or diaphragmatic herniation of the stomach was discussed but the latter was ruled out as there were no suggestive signs in the chest. The absence of a provoking cause and of persistent vomiting negatived the suggestion of acute gastric dilatation It was decided to take the patient into the theatre

Operation.—The abdomen was opened by a left upper paramedian incision under ether anaesthesia and an enormously distended and cyanosed stomach exposed Gastrostomy was performed and a catheter inserted into the presenting part

which was later shown to be the posterior wall of the stomach near the pylorus There was an escape of gas, but only a few ounces of clear fluid of strong acid reaction were evacuated The stomach was so twisted that its pyloric end was under the left cupola of the diaphragm, whilst the cardiac end and the adjoining oesophagus had wound round the pylorus and were lying under the right costal margin There were about four inches of stretched and twisted oesophagus within the abdomen The spleen had been dragged to a position only slightly to the left of the mid line of the upper abdomen The duodenum, together with the head of the pancreas, was drawn upwards and medially towards the left costal margin The stomach was twisted and kinked at both pyloric and cardiac ends and had become an enormously distended closed loop The diagnosis of volvulus of the stomach was thus confirmed and rotation of the stomach in an anticlockwise direction brought it into its correct lie The stomach was still very distended and a tube was passed and two pints of thin blackish fluid evacuated The catheter incision was sutured with two catgut purse strings and the abdomen closed in the usual layers without drainage The patient died twenty-four hours later, and a post mortem examination was made

POST MORTEM FINDINGS

The stomach was enormously distended The whole of the mucosa from the cardiac orifice to the pylorus had the appearance of a phlegmonous gastritis Lying saddle shaped across the lesser curvature in the juxtapyloric region of the stomach were two ulcers, the one nearer the pylorus being half an inch and the other a quarter of an inch in diameter There was much scarring and puckering of the adjacent lesser omentum, which had become considerably shortened The first and second parts of the duodenum were greatly distended, but the mucosa was quite normal The four inches of stretched intra abdominal oesophagus above the cardiac sphincter had the same blackish discoloration of its mucosa as the stomach The liver, spleen kidneys, brain, and heart were normal, as were the lungs and trachea The stomach contents revealed an excess of free HCl and acid haematin, giving a positive guaiacum-ozonic ether reaction

It was presumed in this case that the perigastritis associated with pre-pyloric ulceration, by causing shortening of the lesser omentum attached to the pyloric end of the stomach, had so disturbed the lie of that organ as eventually to lead to volvulus

I am grateful to Mr C H Corbett, honorary consulting surgeon and to Dr Macrae Tod medical superintendent, for their kind permission to publish this case

PHILIP SCIENCE, M D,
Hull Late A M O, Anlaby Road Hospital

Thrombosis of Pulmonary Artery

I record these two cases of thrombosis of the pulmonary artery which I have lately come across because the condition is rare

CASE I

Clinical History—A housewife aged 26 years was admitted to hospital on January 6, 1937, complaining of severe dyspnoea of three days duration which came suddenly on slight exertion twenty days after apparently normal labour On admission the patient was very cyanosed and dyspnoeic The radial pulse was 170 per minute and the blood pressure 110/70 mm Hg There were few crepitations at both bases of lungs The liver was slightly enlarged and tender There was slight oedema of legs and also albuminuria The case was diagnosed clinically as paroxysmal tachycardia She died four days after admission on January 10 The pulse all the time did not fall below 120

Necropsy January 10, 1937 four hours after death There is marked cyanosis of face and slight oedema of legs The heart shows dilatation of its right side with practically no hypertrophy There is no valvular lesion The pulmonary artery and its branches contain a pinkish grey thrombus, which practically occludes the lumen completely The lungs show congestion There is practically no atheroma of the pulmonary arteries or of the systemic vessels The viscera do not show any change beyond passive congestion The uterus is in process of involution, no phlebitis in the pelvic veins is detectable, and there is no evidence of sepsis consequent on labour Microscopically there is no lesion in the lungs beyond some degree of congestion Although the Wassermann reaction was not tested, there was no evidence of syphilis on post mortem examination, either microscopically or naked eye, and also no bilharziasis Histological examination of the other viscera did not reveal any lesions except the passive congestion

CASE II

Clinical History—A housewife aged 50 was admitted to hospital on February 28, 1938, complaining of cough of several years duration, dyspnoea, and oedema of legs On admission the patient, a stout woman, was much cyanosed, the lips and tip of nose being almost black The radial pulse was 90 and regular, and the blood pressure 130/80 The breath sounds were diminished, with few crepitations at bases The liver was four fingers below the costal margin Oedema of cardiac distribution was present, and also albuminuria The case was diagnosed clinically as double mitral and heart failure She died one week after admission, on March 7

Necropsy March 8, 1938 The body is that of an obese woman The lower limbs are oedematous and the face is extremely cyanosed The heart shows marked hypertrophy and dilatation of right auricle and right ventricle, whose wall measures about 1 cm in thickness The left ventricle is slightly hypertrophied The valves and coronary vessels are practically normal The pulmonary artery and its branches contain a pinkish grey thrombus, which is fairly adherent to the vessel walls and largely occludes the lumen The lungs show the appearance of brown induration The bronchi are prominent and filled with mucoid secretion The pulmonary artery and its branches show widespread patches of atheroma There are some old pleural adhesions There is ascites The liver is the seat of chronic venous congestion, and the kidneys and spleen are indurated from the same cause The systemic blood vessels are practically free from atheroma Microscopically the lungs show bronchitis and fibrosis The pulmonary vessels show atheroma, and the thrombus is in process of organization Although the Wassermann reaction was not tested before death there was no evidence of syphilis on post mortem examination, either naked eye or microscopically, and also no bilharziasis The other viscera showed chronic venous congestion on histological examination

COMMENT

The apparent explanation in the first case is that twenty days after labour a clot in one of the pelvic veins was detached on exertion and attached itself to the pulmonary artery It was not of such size as to cause immediate death, but its presence there caused thrombosis in the pulmonary artery and its branches until there was practically complete occlusion of the vessel, and death took place seven days after this accident The second case is apparently a form of Ayerza's disease in which chronic bronchitis, fibrosis of the lungs, and pleural adhesions with atheroma of the pulmonary arteries predisposed to thrombosis in the vessels which was of some standing and in process of organization The cyanosis (cardiacos negros) in these cases was a striking phenomenon, and could not be explained clinically as the condition was not suspected before death Some cases of pulmonary artery thrombosis have been reported, and the condition is fully reviewed by Montgomery in the *Journal of Pathology and Bacteriology* 1935, **41**, 221

My thanks are due to Dr H A Zaki physician to the hospital for giving me the clinical history of the cases

Reviews

LEUKAEMIA AND ITS CONGENERS

Leukemia and Allied Disorders By Claude E Forkner A M M D (Pp 333 73 figures 6 plates 21s net) New York and London The Macmillan Company 1938

After the recent spate of ineffectual and repetitive text books of haematology it is a pleasure to read a monograph which makes a contribution to the knowledge and study of blood diseases Claude E Forkner who has himself done important work on leukaemia has performed the Herculean task of reviewing the literature of leukaemia and allied disorders The preparation of the manuscript called for the survey of about 3 000 references and the more important of these (about 1 600) are cited in the text and given in full at the end of the book There are five useful colour plates Leukaemia is defined as an invariably fatal systemic disease of unknown etiology primarily involving the blood forming organs and characterized by widespread rapid and disorderly proliferation of the leukocytes and their precursors and by the presence almost without exception at some time during the course of the disease of immature leukocytes in the blood often in very large numbers

It is now almost a hundred years since the classical description of leukaemia yet to day we know almost nothing about its cause or its specific treatment Nevertheless a great deal has been learnt about its comparative pathology its incidence and its clinical features Leukaemia is widespread throughout the animal kingdom and in fowls it is so common in certain areas as to be a menace to the chicken raising industry Leukaemia can be transmitted by cell free filtrates in birds and by cellular implantation in mammals but attempts to transmit leukaemia from man to man or from man to animals have met with no success In one remarkable instance a donor who a few days later developed acute leukaemia gave blood for the transfusion of a patient who had severe secondary anaemia the donor died but the recipient did not develop leukaemia There can be little doubt however that leukaemia as it appears in the lower mammals is the same disease as in man and the experimental pathologist cannot complain of shortage of material The more work that is done the closer becomes the parallel between leukaemia and the new growths and similar aetiological factors such as hereditary susceptibility tissue irritation and a virus are suggested The most bizarre symptoms may arise from infiltrations of leucoblastic cells and the reaction of the tissues to their presence and Dr Forkner has clearly described and figured the less familiar manifestations in the skin the mucosae and the bones and joints Spontaneous remissions occasionally occur in the acute and subacute forms of leukaemia though they are apparently rare, spontaneous or induced cure of an authenticated leukaemia is very much rarer, but there are three or four cases which might pass muster

It may be a hard thing for the physician to accept but there is no evidence that any treatment extends life in acute leukaemia and on the contrary it sometimes appears to hasten death In chronic leukaemia much may be done to add to the comfort and promote the general health of the patient The most striking advance was the introduction of *x* ray therapy but the hope of the last thirty years that more powerful *x* ray equipment more accurately controlled dosage and more scientific knowledge concerning the biological effects of *x* rays would result in marked improvement in treatment of leukaemia has not been fulfilled It must seem apparent to all that if leukaemia is to be really satisfactorily treated other means than irradiation with *x* rays and radium must be sought Dr Forkner has confined himself fairly strictly to leukaemia and has hardly touched on multiple myeloma or on the group of reticuloses which occupy the unfamiliar tract of country between the leukaemias and Hodgkin's disease Within the territory to which he has limited himself Dr Forkner has organized and classified knowledge without regimenting it or perverting it to a theory and has thus performed a major service to haematology

CHARACTERS OF THE PNEUMOCOCCUS

The Biology of Pneumococcus The Bacteriological Biochemical and Immunological Characters and Activities of Diplococcus Pneumoniae By Benjamin White Ph D With the collaboration of Elliot Stirling Robinson M D Ph D and Laverne Almon Barnes Ph D (Pp 799 illustrated 4 50 dollars 20s net) New York The Commonwealth Fund London Humphrey Milford Oxford University Press 1938

The authors of this volume have attempted the formidable task of reviewing the extensive literature which has accumulated during the last fifty years on the bacteriological biochemical and immunological characters of the pneumococcus The first chapter opens with an interesting historical account of the early work on the pneumococcus and in succeeding chapters morphological cultural and biochemical characters classification transformation of types pathogenicity for animals and for man chemical nature of the antigens of pneumococcus antibodies and active and passive immunization are considered in detail For the sake of completeness a chapter on serum treatment has been included but this aspect of the subject has been treated at greater length in a companion volume since issued by Drs R Heffron and F T Lord On page 471 the authors state in relation to the discussion of dermal allergy that their primary purpose has been to recite the many observations as they have been reported in the literature in order that no contributions whatever might be their value should be neglected This principle has been largely followed throughout the book and while this treatment makes the volume useful as a source of reference it does not always make for easy reading

The description of the methods which have been evolved for the determination of pneumococcal type is not always clear and the phrase protection test appears to be used when simple mouse inoculation with infective material is meant (pp 121 and 133) In Chapter V an interesting account is given of the experimental work on the transformation of pneumococcal types which began with the pioneer researches of F Griffith In this chapter a few errors are to be found On page 148 for instance Dawson is reported to have obtained Type I R pneumococcus by growing a freshly isolated Type I S strain in 25 per cent Type I anti-R serum and the experiments attributed to Dawson's paper published in 1928 (p 137) were recorded in a paper published two years later In certain other instances inaccuracies occur and in the quotation from Abernethy's paper (p 369) the substitution of the word inactive for reactive gives a false interpretation of the facts

The fundamental researches of Avery and his colleagues on the antigens of the pneumococcus indicating clearly for the first time the importance of complex polysaccharides in the antigenic make up of bacteria have pointed the way to many of the recent advances in our

knowledge of bacterial antigens in relation to immunity The chapter on the chemical constituents of pneumococcus gives a very clear account of the development of knowledge in this field, and the many contributions of various workers have been admirably analysed In the effort to make the review of various aspects of the subject as complete as possible a certain amount of repetition has been inevitable, and this is perhaps most obvious in the chapters dealing with antigenicity of pneumococcus, antibodies to pneumococcus, and host response to antigenicity of pneumococcus In the summary to Chapter XI (p 423), and again in the following chapter (p 445), the various manifestations of antibody activity are discussed as if these were due to separate substances in the serum of immune animals, although there is ample evidence, quoted elsewhere by the authors, that many of these effects are due to a single antibody directed against the type-specific polysaccharide

The recent work on the newer sulphonamide compounds in pneumococcal infections suggests that there will soon be available a more effective drug than the cinchona compounds discussed in the chapter on chemotherapy Nevertheless it seems probable that the production of anti-pneumococcal serum, which is very fully treated in this book, will remain a matter of the greatest importance in the treatment of pneumococcal infections Special methods used in the study of pneumococcus and in the preparation and standardization of antisera are given in a useful appendix which covers forty-two pages The more recent work of Heidelberger and his colleagues, however, has shown that more accurate results can be achieved by modifications in technique recently introduced than by the method of nitrogen determination on specific precipitates as outlined on pages 643 and 644

The extensive bibliography occupies 105 pages, and the index twenty-nine pages In spite of minor inaccuracies in this volume, some of which have been noted above, this book may be recommended as a valuable review which indicates the sum of our knowledge of the pneumococcus acquired during recent years, and should prove of the greatest value as a work of reference for those interested in the bacteriology and immunology of pneumococcal infection

THE REFRACTION OF THE EYE

Refraction of the Eye including Elementary Physiological Optics By Charles Goulden, M D, M C F R C S Introduction by Sir John Herbert Parsons, F R C S F R S Second edition (Pp 271 181 figures 12s 6d net) London J and A Churchill 1938

For the most part medical practitioners attached to hospitals who confine their practice to eye work are called ophthalmic surgeons The name is not altogether without ambiguity to the lay mind, which associates the word "surgeon," especially in connexion with hospitals, with operations—cutting operations So there is a tendency for such practitioners to call themselves ophthalmologists, with the idea of correcting this ambiguity The improvement in the general health of the community has without doubt lessened the volume of operative ophthalmic surgery as compared, say, with some Eastern countries But with that improvement there is associated an increase in the demands upon the eyesight of the people of all grades, for fine technical work is the mark of high industrial development That change has increased the demand upon the skill of the ophthalmologist in detecting reasons for tired eyes, and in finding means for the prevention of that tiredness This is now the chief part of the work of the ophthalmologist, certainly in volume, and probably in importance

Mr Charles Goulden has produced a second edition of his book *Refraction of the Eye* Since it is the outcome of a series of lectures on physiological optics delivered at the Royal London Ophthalmic Hospital to students preparing for the diploma in ophthalmic medicine and surgery of the Conjoint Board of the Royal Colleges of Physicians and Surgeons, it is a combination of theoretical and practical instruction that is well balanced It is an excellent book, clearly written with commendable brevity, and admirably illustrated It should prove a useful help to the student and a good remembrancer to the practitioner Like all Churchill's books it is well printed

POISON GAS

On Guard against Gas By H A Sisson O B E, M A, F C A (Pp 91, 2s net) London Hutchinson and Co 1938

Breathe Freely The Truth about Poison Gas By James Kendall, M A, D Sc F R S (Pp 179, 3s 6d net) London G Bell and Sons 1938

On Guard against Gas, by Major H A Sisson, is a book that can be recommended to all who desire a well balanced account of the probable dangers of gas attacks and the best means by which they may be minimized The author was D A D Gas Services at G H Q in France and hence has an accurate knowledge of the potentialities of poison gas His view is that gas will play a subsidiary part in air raids, that it will be combined with high explosive and incendiary bombs, and will be used mainly to create panic and to hamper the work of rescue and reorganization He is also of the opinion that mustard gas is the substance most likely to be used Naturally he is under no illusions about the highly unpleasant properties of this substance, and indeed he remarks "It is probable that mustard gas will play as large a part in the history of the human race as gunpowder has" On the other hand, he points out that panic is the best friend of gas, and that if the population does not give way to panic but keeps under the shelter of houses in rooms made as gasproof as possible, then gas by itself will cause relatively few casualties and is probably much less to be feared than is the high explosive bomb The book opens with an interesting account of the history of gas warfare, gives a short account of the properties of the chief gases, and finally gives a brief and clear account of the methods of defence Gas attacks are very much in the public mind at present No one can foretell what will be the result of an intensive gas attack on a big city, but a few persons who, like Major Sisson, have a really extensive first-hand knowledge of gas warfare are in a position to make an intelligent forecast For this reason his book is of quite exceptional interest

Breathe Freely by Professor J Kendall, is a book that arouses varied emotions The author performs a useful public service by ridiculing in a very entertaining manner an assortment of the many silly exaggerations that have been written about the perils of poison gas The book also contains a large amount of important specialist information For example, the author states and explains the physico-chemical laws that limit the employment and action of gas, and shows the impossibility of poisoning a city by a few gas bombs or of raining down a "dew of death" on an area provided with adequate anti-aircraft defence One feels, however, that in his laudable endeavour to allay panic he at times becomes unduly sanguine The casual reader might, for instance, be left

with the impression that mustard gas was a harmless bogy whereas experience teaches that an area that has been plastered with this substance is a highly unpleasant and dangerous place of residence and also is extremely difficult to clean up So much nonsense has been talked about the dangers of poison gas that a counterblast is welcome but it is desirable not to err on the other side by unduly minimizing the dangers since in the unhappy event of air raids on Britain becoming realities instead of fears of the future carelessness and lack of preparation might be worse dangers than panic Furthermore panic may be aroused not only by exaggerated fears but also by approaching a real danger with unwarranted optimism

DIETETICS

Treatment by Diet By Clifford J Barborka R S M S M D D.Sc F A C P Third edition revised (Pp 642 illustrated 21s net) Philadelphia London New York Montreal J B Lippincott Company 1937

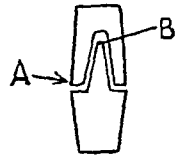
Dr Barborka's book on treatment by diet which appeared first in 1934 has now been issued in a third edition The general scope of the volume an earlier edition of which was reviewed in this *Journal* in July 1935 is essentially unchanged After an introductory section on the dietary requirements in health dietetic treatment of disease is discussed in detail In some diseases dieting is of paramount importance in all it must be considered by the attending physician Each disease heading has a short statement of the dietetic indications and these are then worked out in a series of set diets which may be immediately adapted to the particular case The book is to be recommended as a useful addition to the reference books beside the consulting room desk even allowing for the differences of foods which are found on American and English tables Most of the sections are well prepared and orthodox in dealing with gout though many gouty patients are benefited by reduction of total intake we cannot agree with the high carbohydrate diet recommended by the author A general reduction in diet giving adequate protein provided it is of low purine content, is we believe suitable in practice

Notes on Books

L'Annee Therapeutique for 1937 (Masson 25 fr) is the twelfth of a series which aims at giving an annual summary of recent advances in medical treatment The author has drawn his information from recent publications in France and abroad and presents the work of the year under the headings of certain diseases and their symptoms and means of alleviation modern methods of treatment in anaesthesia radiotherapy autohaemotherapy and artificial fever and new medication Among the latter mandelic acid the new forms of insulin and compounds of barbiturates para aminophenylsulphamide (prontosil etc) and recent progress in knowledge of vitamins are dealt with The result is a considered review of modern therapeutics and is not merely a compilation There is a good index, and the cross reference arrangement gives a useful conspectus of recent advances

To Drink or not to Drink by CHARLES H DURFEE Ph D is published by Longmans Green (6s) The problem of alcoholism must always be an interesting and important one and recent legislation in America and its repeal have raised this question in an acute form in that country The present volume is an exposition by an educational psychologist of his method of treating patients by making them work out their emotional reactions in manual tasks on the farm colony which he has organized, together with a certain amount of simple psychological discussion Most of those who have studied the problem will agree with the author that alcohol is but a symptom of an underlying personality problem and that it is not enough for the patient simply to know why he is alcoholic he must alter his emotional attitude towards life and learn to live without alcohol The methods advocated by Dr Durfee will undoubtedly be successful in some cases but it would be a mistake to think that in this volume the subject has been covered completely or the last word said on the treatment of alcoholism

Preparations and Appliances

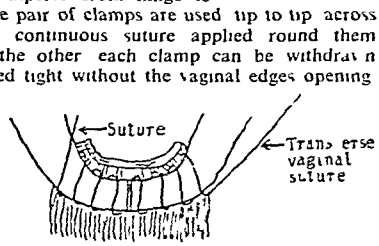


SET OF NON SLIPPING HYSTERECTOMY CLAMPS

Mr KENNETH MCMILLAN F R C S honorary surgeon Birmingham and Midland Hospital for Women and Birmingham Maternity Hospital writes

The two main features of these clamps are that the blades are deeply grooved longitudinally instead of transversely and that the groovings articulate accurately This longitudinal grooving has been used before but the vertical depth of the blades was insufficient to prevent distortion when gripping tough tissues so that the tissue slipped out frequently particularly when clamping the vagina

The complete set consists of two angled ovarian pedicle clamps two slightly curved uterine artery clamps of modified La Foure pattern two straight cervical artery clamps and two very powerful curved vaginal clamps The ovarian clamps are angled so that the handles hang down over the edge of the wound out of the surgeon's way



In section the blades represent an isosceles triangle the two long sides giving a much stronger grip on the tissues than the short base of the ordinary clamp The shoulder at A prevents the tissues from being cut through and the edge at B is finished quite bluntly for the same reason Thus tissue paper can be held firmly without cutting or slipping as well as the toughest pedicles The jaws of the straight cervical artery clamps are of the same design and produce a most satisfactory pedicle to tie in a rather inaccessible and deep position The uterine artery clamps are of the same general design as La Foure's pattern but with the grooves in the jaws deepened and running longitudinally

The powerful vaginal clamps are deliberately made heavy enough to avoid any distortion under load The curved jaws are deeply grooved longitudinally and the grooves articulate accurately as shown in the enlarged section illustrated here The jaws are also tapered from hinge to tip so that when the pair of clamps are used tip to tip across the vagina and a continuous suture applied round them from one side to the other each clamp can be withdrawn and the suture pulled tight without the vaginal edges opening

In addition to their special use in gynaecology it is possible the clamps may prove useful in general surgery as well Messrs Philip Harris and Co (1913) Ltd of Birmingham have kindly made them for me Rough unpolished models were first made and tried at operations until the right spring and grip were obtained for each pair

INCONTINENCE FROM ACCUMULATION OF FAECES IN THE RECTUM

BY

HAROLD DODD, Ch M, F R C S

Surgeon to King George V Hospital Ilford and to the Royal Hospital Richmond

Incontinence of faeces during an illness is a very tiresome feature both to the patient and to the nurses This incontinence may be due to an accumulation of faeces impacted in the rectum, so large and hard that it is impossible for the patient to pass it That this is an occasional cause is not, in my experience, generally recognized, fortunately it is one which is readily amenable to treatment Comparatively recently I have seen four such cases of faecal incontinence which, while presenting the same urgent symptom, have stimulated totally different diagnoses They appear to be interesting enough to merit a short description

Case I Perforated Duodenal Ulcer, Query "Organic Nerve Disease"

A man aged 48 was suffering from general peritonitis and severe abdominal distension three days after the suture of a perforated duodenal ulcer I was asked to see him because he was *in extremis* I advised sedatives and heat to the abdomen, continuous gastric lavage and intravenous saline, and no aperients, enemata, or injections He steadily improved I saw him again sixteen days later because he was incontinent of faeces, a bad prognosis had been formulated, querying an organic nervous disease as well as a peptic ulcer A glance at his tranquil countenance, his moist clean tongue, and his equal reacting pupils, with a normal pulse and temperature tended to negative this suggestion The abdomen was doughy and soft but not distended, and a finger in the rectum found a hard mass the size of a foetal head, it was too large and firm to pass through the anus During the course of the next few days this was removed by digital morcellement, with complete recovery

Case II An Unusual Case of Acute Intestinal Obstruction

I was called to hospital to see a woman of 37 with an acute intestinal obstruction She was already in the ward under the care of my physician colleague for indigestion and anaemia She was now suffering from acute abdominal pain, vomiting, and a distended but not tense abdomen and had been constipated for the previous four days Two enemas had been given with but coloured faecal results, and little or no flatus was passed The diagnosis appeared to be a clear one of mild acute intestinal obstruction Further, she had developed incontinence of urine in the previous twelve hours The routine examination of her rectum revealed a mass even larger than a foetal head The house physician said he had done a rectal examination and that he didn't know what to make of it—he had never felt anything like it before Removal of the accumulation with the gloved finger and olive oil enemas gave complete relief

Case III Enlarged Prostate, Retention of Urine, Query Uraemia

A man aged 67 was admitted to hospital with retention of urine from enlargement of the prostate His bladder was decompressed, suprapubic cystostomy was performed, and he progressed well for three weeks when my house surgeon ventured the opinion that uraemia was beginning, for the patient didn't seem so well, had a threatening bedsore, and had become incontinent of faeces The ward sister stated that the bowels had been opened on alternate days by an enema An examination of the rectum revealed a mass quite the size, and almost the consistency of a cricket ball, this was with difficulty removed with the gloved finger, after which continence returned

Case IV "Inoperable Carcinoma of the Rectum" with Intractable Pain

I was asked to see an old lady aged 82 who was suffering from chronic intestinal obstruction which had become acute owing to a huge inoperable carcinoma of the rectum" For two weeks she had been incontinent of faeces and urine, groaning day and night with pain, which was only partially relieved by frequent morphine injections The relatives were strained to the utmost with the nursing, and the doctor was seriously embarrassed by calls every three to four hours for sedatives, day and night The question raised was whether an intrathecal injection of absolute alcohol would be of service The patient was *in extremis*, with a wooden dry tongue and a pulse of 120, and the respirations were shallow and slow She was vomiting freely, and the problem of her nourishment and nursing was an acute one A finger in the rectum met with a surprise in the shape of a huge faecal mass which had been mistaken for an inoperable carcinoma of the rectum It was an enormous aggregation that could be ballotted bimanually, this also explained the urinary incontinence

It was gradually extracted, together with daily warm olive oil enemas A very anxious time followed detoxicating the patient from the large amounts of morphine and hyoscine she had had

Commentary

These patients illustrate four possible manifestations after a major gastric operation, raising the question of central nervous disease, acute intestinal obstruction in an obscure case of indigestion, uraemia after retention of urine from an enlarged prostate, and intractable pain from an inoperable carcinoma of the rectum In two instances, Cases I and III, the rectal examination had been omitted, recalling the aphorism that "if you don't put your finger into the rectum you will put your foot in it" In Cases II and IV a finger had investigated the rectum without the condition being recognized—a *raison d'etre* for this note, and suggesting the necessity for educating the finger in rectal pathology by assiduous practice In these days of slogans the following might prove an apt reminder "Put your finger into the rectum, you may find a brick in it"

The incontinence takes the form of a continuous discharge of faecal coloured fluid, a mixture of mucus which dissolves faeces from the mass The mucus is poured out in response to the mechanical irritation of the bowel It is this discharge which suggests that the bowel lumen is patent and tends to conceal from the observer that extreme constipation is the actual cause

Treatment

The treatment of the condition is simple, being that of digital removal of the hard faeces, assisted by olive oil enemas, the rectum is usually clear in two days, but it may take a week before the colon is empty and continence returns The procedure must be carried out with gentleness, lest the anal canal be lacerated and bleeding or a perianal abscess be thereby excited, for these subjects are usually debilitated, and sepsis starts readily in this area, which is already catarrhally inflamed For this reason spoons and forceps are never used, only a gentle intelligently directed finger.

The *Annales de la Societe Belge de Chirurgie et Journal de Chirurgie* has recently issued a volume containing articles by Dr Oct Coquelet on Surgical Affections of the Lung and the Bronchi, by Dr Jean Govaerts on Tumours of the Lung' and by Professor Christophe and Dr Laduron on Reparative Surgery of the Peripheral Nerves'

THE VITAMIN B COMPLEX

Until about thirteen years ago vitamin B was regarded as one substance with two functions it cured or prevented beriberi in man and polyneuritis in pigeons and it was necessary for the growth of rats In many food substances tested the amount that had to be added to the vitamin-B-deficient diet of the rats in order to make them grow bore a fairly constant ratio to the amount that was needed to cure a pigeon of polyneuritis allowance being made even in those days for the variation in response of different animals to equal doses of the same substance However as details of experimental technique with animals came under more careful control it became evident that the ratio of the anti beriberi potency to the growth promoting potency in different substances varied widely A substance which could cure polyneuritis in pigeons by a very small dose was not nearly so potent in promoting growth in rats otherwise deprived of vitamin B This was particularly evident in the vitamin B concentrates prepared by the method of Peters and his co workers The more potent his concentrates became in their antineuritic property the less effective were they in supplementing the vitamin-B-deficient diets of rats It was known at this time that by autoclaving yeast its anti neuritic potency was destroyed and that it could not make good the deficiency of the rats' diets Workers in several laboratories, however, soon showed that when anti neuritic concentrates and autoclaved yeast were given to rats fed on the vitamin-B-deficient diet the animals could grow This then proved the existence of two factors at least in vitamin B and they were tentatively named vitamin B_1—the anti neuritic and more heat labile constituent—and vitamin B_2—the more heat stable constituent In the USA some workers preferred to call these two factors B and G others F and G

Further work revealed the existence of other factors which were water soluble and therefore classified temporarily as B vitamins One factor present in wheat germ was found to be necessary for the maintenance of weight in pigeons and named vitamin B_3 Another very heat labile factor in yeast necessary for the rat and chick received the name vitamin B_4 another necessary for the pigeon, was named B_5 and another necessary for the rat (anti dermatitis) was named B Still another factor present in liver extract is regarded as preventing dermatitis in chickens it is generally known as the 'filtrate factor It could not be determined which of these was the anti pellagra factor for none of them was obtainable in a pure form except vitamin B_1 which was completely ineffective in the treatment of pellagra Further work on what had been called vitamin B_2 demonstrated that the effects were due to two substances at least—lactoflavin known as riboflavin since its composition was determined and the anti-dermatitis factor previously called vitamin B which Lepkovsky[1] has recently claimed to obtain in crystalline form—but neither of these proved to be the pellagra preventive factor Less than twelve months ago however Elvehjem showed that nicotinic acid cured black tongue in dogs a condition which is thought comparable with pellagra in man and clinical trials have since proved that nicotinic acid can indeed cure the most typical symptoms in the pellagra syndrome Carter and O Brien[2] have now confirmed the earlier findings of the pigeon s need for vitamins B_1 B_3 B and riboflavin Macrae[4] declares that the rat requires vitamin B_1 lactoflavin an unidentified factor present in an autoclaved aqueous yeast extract after extraction with fuller's earth (yeast filtrate factor) and an unidentified factor present in the barium hydroxide eluate of a fuller s earth adsorbate from an autoclaved aqueous yeast extract (yeast-eluate factor) Nicotinic acid was not either of these yeast factors Amyl alcohol extracts prepared from liver extracts contained a growth factor for rats distinct from all the preceding ones Thus the number of factors tentatively included in the term vitamin B complex is by no means clearly determined Those whose existence is generally accepted at present are B_1 (aneurin or thiamine), lactoflavin (riboflavin) vitamin B_6 (the rat anti-dermatitis factor), and nicotinic acid (the anti-pellagra factor) Others accepted by many workers are vitamins B_3 B_4 B the liver filtrate factor (chick anti-dermatitis factor) and Macrae s yeast-filtrate and yeast-eluate factors

[4] Ibid 2275

Returning to vitamin B_1, it may be recalled that Westenbrink[3] showed that by feeding rats on a diet free from this all the tissues of the rats except the brain became depleted of their reserves of vitamin B_1 within five or six weeks The amount stored in the tissues is limited but dependent on the intake Excess is excreted in the urine Harris and Leong[6] have stated that "a daily excretion of less than 12 International Units raises the presumption that the diet contains less than a normal allowance of vitamin B_1" Babkin[7] has demonstrated that the gastric glands of dogs on the vitamin–B–deficient diet do not respond to the usual stimuli—sham feeding, subcutaneous injection of histamine, the presence of food or 5 per cent solution of alcohol in the intestine When yeast was administered the responses became normal, but the effective substance in the yeast was not determined These results may afford an explanation of the anorexia so characteristic of vitamin-B_1 deficiency Molitor and Sampson[8] have found that vitamin B_1 is without influence on the contractions of the intestine The role of vitamin B_1 in the metabolism of carbohydrate, fat, and protein is still a subject for experiment Peters and his co-workers[9] have postulated the theory that it acts as a co-enzyme in the metabolism of carbohydrate, more especially in the oxidative breakdown of pyruvic acid This is supported by a large amount of experimental work on the ratio between oxygen uptake and disappearance of pyruvic acid in normal brain tissue and in brain tissue of pigeons suffering from vitamin-B_1 deficiency It is suggested by Lipmann[10] that vitamin B_1 is converted into vitamin pyrophosphate by the brain tissue, and that in this form it acts as a co-ferment helping either the carboxylase to break down the pyruvic acid to acetaldehyde and carbon dioxide or the oxidase to oxidize the pyruvic acid to acetic acid and carbon dioxide

Vitamin B_1 exerts a demonstrable action only with B_1-deficient animals Excess dosage has no effect No toxic symptoms have been observed when amounts 25,000 times the estimated daily requirement were administered Hawes[11] has obtained dramatic cures by giving large injections of vitamin B_1 to patients suffering from acute fulminating cardiac beriberi Stern[12] has injected synthetic vitamin B_1 in doses of 500 to 50,000 International Units intrathecally for the relief of intractable pain and for inflammatory and degenerative diseases of the central nervous system The action of the vitamin is much quicker when injected than when given by mouth[7] Fischer,[13] determining the amounts of vitamin B_1 in the crystalline lens in cases of cataract, found less of it and more pyruvic acid than in the normal lens, and concluded that the vitamin plays an important part in the oxidation-reduction system of the lens The question of the presence of vitamin B_1 in white and wholemeal flours and breads has lately been reinvestigated by Copping and Roscoe[14] They found that straight-run white flour, whether new or old, bleached or unbleached, contained 0 37 International Unit per gramme Patent flour contained none and wholemeal 1 18 units per gramme Bread made with yeast had no more vitamin B_1 than the flour from which it was made Thus a man would have to eat each day more than half a pound of white bread made from straight-run flour —not from patent flour—in order to obtain about a quarter of the vitamin B_1 needed The importance of brown bread or of wholemeal bread in the diet was stressed in these columns recently[15]

Day, Darby, and Cosgrave[16] claim to have shown that riboflavin is the anti-cataract factor, but Morgan, Cook, and Davison[17] are of the opinion that the filtrate factor is the anti cataract factor They believe that both flavin and vitamin B_1 are produced, probably by micro organisms, in the intestines of rats fed on large proportions of lactose, but this did not prevent the development of cataract in a large proportion of their rats They found that the filtrate factor was in corn starch or was produced in the intestines when corn starch was given in the diet Carlsson and Sherman[18] have demonstrated that the amount of riboflavin stored in the body depends on the diet of the animal In well-nourished animals the concentration of riboflavin in the liver was ten times that in the skeletal muscles, the concentration in the kidney, brain, and spleen was intermediate between these extremes Sebrell and Onstott[19] have determined that the condition in dogs which they had previously described as "yellow liver" is due to a lack of riboflavin and can be cured rapidly by early parenteral administration of that substance

This survey of a number of the recent studies on the B vitamins gives some idea of the complexity of the work that is being carried out and also of the intensity of the attack of the biochemist on the multifarious problems presented to him The debt of the clinical worker to biochemistry increases every year

THE BLIND MAN IN RELIGION

In animal communities and primitive human societies blindness is probably always regarded as anti social and the blind member of the herd is put to death or ostracized Compassion as a religious sentiment is a comparatively late development and a mark of a certain advance in civilization Treatment of the blind may be a fairly reliable index of this sentiment because their misfortune is obvious and severe and yet makes comparatively slight demand upon the charity of their fellows M Étienne Ginestons has collected some interesting and out of the way information in a recent paper[1] - on the status of the blind in various religious systems The old Brahmin law as set out in the Manava Dharma Gastra, laid down that the blind with other sufferers from special sense defects could not inherit property but imposed on the inheriting kinsman of a disqualified person a rule of equity that he should so far as his means allowed, maintain the sufferer during life The idea of blindness as a divine punishment or the work of evil spirits seems to have conflicted with the view that it was a misfortune for which God compensated the victim by the gift of magical powers The legal treatment of the blind man therefore safeguarded the community from divine wrath in either direction—by making him a pariah, but at the same time allowing him the necessities of life as the possessor of a socially valuable second sight

The Old Testament is full of allusions to the blind Sightless men must have been for thousands of years as frequent and familiar in the East as they are to day Sometimes blindness is looked on as an arbitrary act of God sometimes it is a natural accompaniment of old age sometimes it is a punishment either direct or vicarious for sin occasionally as in the case of Tobit it is a trial of faith Leviticus forbids a Jew to put a stumbling-block before the blind and Deuteronomy contains a curse, in the mouth of the Levites on him who maketh the blind to wander out of the way On the other hand a blind man may not offer the holy bread, nor may a blind beast be sacrificed The attitude of Christ towards the blind that they deserve all possible consideration and encouragement was new to the East—at any rate as a canon of ordinary behaviour—and is the basis of their treatment to day in civilized countries Miraculous restoration of sight is one of the commonest of the miracles attributed to Christian saints The Prophet of Islam also taught a charity towards the blind which was a great advance on the manners of Arabia in his time M Ginestons quotes one or two verses of the Koran which say that sight and blindness are sent by Allah at his discretion and the general tendency of that scripture is to treat blindness as an objective phenomenon without attaching to it any sentiment of awe or recrimination The author might perhaps if he had chosen have quoted many injunctions to give alms to the blind, and the most striking of these is perhaps the opening verse of the chapter known as *Abasa* 'He scowled' In that verse God reproaches the Prophet himself through whose mouth he was speaking for scowling and turning away when a blind man asked him for alms The Wine Song of Omar ibn El Fārid a famous mystical poem of the Sufis says of the wine—one of the symbols, as Jung might say of the unconscious libido—that if it shines on the eyes of a blind man at night he will see in the morning Discussing the attitude of the Christian Church M Ginestons records that in the Roman Catholic priesthood blindness disqualifies from celebrating the mass, but a special dispensation may remove the disqualification In the Protestant communions it is not in itself a bar to ordination or the fulfilment of any pastoral duty

ALLERGY AND IMMUNITY IN OCULAR TUBERCULOSIS

Rich and his associates at the Baltimore School have been insistent in their teaching that allergy and immunity are two distinct processes In this they have been supported by painstaking work from the highly organized Wilmer Ophthalmological Institute Woods Frieden wald and their collaborators have shown in a series of publications that the extension and progression of an established tuberculous lesion in the eye are due to hypersensitivity of the ocular tissues in the presence of low resistance while limitation and healing are associated with low tissue sensitivity and high resistance In other words the inflammatory caseating and necrotizing phases of ocular tuberculosis are allergic whereas encapsulation and healing of the lesion are due to immunity A profound difference in the approach to treatment is bound up in this theoretical problem On the assumption that allergy and immunity are related tuberculin has been used to produce minimal allergic reactions around a focus of infection in the belief that these reactions bring with them a degree of immunity If immunity is unrelated to allergy ther the rational use of tuberculin is confined not to producing lesions which will produce immune bodies but to desensitizing the tissues Woods and Randolph[1] have studied these two different methods of using tuberculin in human ocular tuberculosis and they have shown that better results were obtained by giving tuberculin on the basis of the concept of desensitization than on that of the perifocal

[1] *Arch Ophthal* Chicago 1937 18 510

concept This approach raises the all-important question of the relation between cutaneous and ocular sensitivity, and to these problems Woods, Burky, and Friedenwald[2] devote a series of important studies They show that under experimental conditions the healthy eyes of rabbits infected systemically with tubercle bacilli participate in the general sensitivity to tuberculo-protein, the sensitization of the skin being determined by the usual intradermal test and that of the eyes by injecting purified protein derivative into the anterior chamber Both ocular and cutaneous sensitivity develop synchronously about the third week and reach their peak about the sixth to the eighth week Woods and his co-workers hold that cutaneous sensitivity gives a fairly reliable index of the degree of ocular sensitivity They further found that when tubercle bacilli are injected into the anterior chamber of one eye sensitivity is produced in both eyes and to a lesser extent in the skin, becoming apparent at the end of the second week and reaching its height by the fifth week The eyes showed progressive tuberculous inflammation during the first few weeks, becoming acute with the production of caseation and necrosis as the ocular sensitivity advanced to a maximum Active tuberculous inflammation and ocular sensitivity persisted steadily up to the sixteenth week, after which both ocular sensitivity and active inflammation subsided synchronously, the eyes thereafter showing evidence of scarring and repair In the final stage of comparative inactivity there were occasional minor exacerbations, and these suggested a return of ocular hypersensitivity These important findings open once more the question of the scope and limitations of tuberculin therapy in ophthalmology Clinicians have of course recognized for many years that high doses of tuberculin are to be scrupulously avoided, and there is evidence that the early results that were claimed for tuberculin might very likely have been the transient improvement from hyperpyrexia induced by the protein shock of massive doses of tuberculin The use of small doses has come with clinical experience, and if desensitization can be achieved without pushing tuberculin to the limit of producing minimal inflammatory reactions the outlook for tuberculous allergic eye conditions is distinctly more promising

RADIOTHERAPY OF ACTINOMYCOSIS

For a relatively uncommon disease actinomycosis has been the subject of a rather extensive literature Much of this, however, is devoted to the bacteriological aspects of the disease, and statistics as to the results of treatment are very few A recent monograph by Axel Renander[3] on the treatment of fifty-two cases of actinomycosis at the Radiumhemmet is therefore to be welcomed It is well known that the commonest site of the disease is in the neck and face (56 per cent of all cases), and that here the prognosis is good Cope[4] estimates that 97 per cent of the cervico-facial group are ultimately cured Twenty-six of Renander's thirty-one cases were cured a proportion very like that found by Duvan before the advent of radiotherapy It is therefore doubtful whether treatment by radium or by x rays improves the prospect of cure in this group, but the duration of the disease is probably shortened and the ultimate scarring less Abdominal actinomycosis, constituting 22 per cent of all cases, shows a recovery rate of about 32 per cent under iodides and surgical measures, of Renander's thirteen cases treated by radiotherapy five were cured, and he quotes also Grunthal's statistics of 45 per cent cures in thirty-three cases The numbers treated are too small for any valid conclusion to be drawn, but it is probable that radiotherapy has improved the prognosis, and the same is perhaps true of the thoracic form of the disease, although Renander's three patients in this group all died The mechanism of action of radiations in actinomycosis is unknown, but, as in other infections, it is certainly not by a lethal effect on the organism itself It is more probable that the effect is mainly on the leucocytes, their destruction may be regarded as equivalent to a "decompression" operation, and allows of an alteration for the better of the condition of stalemate present in a chronic inflammatory focus Iodides are presumed to have a similar effect, promoting the softening and absorption of the cellular infiltration The massive single dose of radiation seems to have been founded on the misapprehension of a lethal effect on the organism, and Renander recommends small doses of the order of 150 *r*, and the repetition of such series after intervals of two months A study of his case reports emphasizes the point that great persistence is required on the part of the radiotherapist, many cases having five or six series of treatments It is perhaps better still to follow Finzi's technique of even smaller doses (75 to 100 *r*) twice weekly without interruption until cure is obtained If the temptation to increase the dose and the discouragement at the slow rate of progress are avoided the number of deaths from the disease in this country (about sixty per annum) might be further reduced

SWALLOWED FOREIGN BODIES

Leaving aside those queer people who for a wager swallow nails, and the mentally deranged who are dirt eaters or have a predilection for some other noxious substance, there are others, chiefly children, who quite inadvertently swallow foreign bodies It may be a pin held in the teeth while dressing, a coin from the plum pudding, a piece of glass from a broken bottle or a denture In the *Journal* of March 5 (p 514) three practitioners in Shanghai, Drs J E Bowen, G Chambers, and W R Johnston, reported the case of a Chinaman, aged 24, from whose ileum fifteen foreign bodies resembling pebbles were removed These were regarded as encrusted fruit stones which he had swallowed in childhood, and had been giving rise to symptoms for ten years before their removal F F Henderson and E A Gaston[1] find that a swallowed foreign body which passes through the intestinal tract naturally does so within seven days as a rule, regardless of the age of the patient or the type of foreign body A double edged safety-razor blade has made a successful

[1] *Arch Surg* Chicago, 1938, 36, 66

journey through the alimentary tract and of 800 cases of swallowed foreign bodies seen at the Boston City Hospital only nine (just over 1 per cent) caused perforation The actual percentage of perforations is probably lower even than this since not all the uncomplicated cases are brought to hospital When perforation occurs the stomach is most often the site and the usual type of perforation here is of a chronic character Acute perforations more often arise in the small bowel or caecum Objects pointed at both ends are considerably more dangerous than those pointed at one end only The course of an object which is liable to perforate or become impacted should be followed by x ray examination Laparotomy is called for if localized abdominal tenderness occurs It is worth noting that in none of the reported cases of perforation by a foreign body with abscess formation has the actual site of perforation been found and in none of the cases has a faecal fistula developed after drainage of the resulting abscess An analysis of fifty seven cases of perforation by foreign bodies in which the result of treatment was known revealed a mortality of 14 per cent Preventive measures are perhaps obvious but it may be mentioned that mothers should avoid putting pins in their mouths particularly in front of their children who may swallow a pin while attempting to imitate this bad habit The ordinary pin is the foreign body most often swallowed, and it usually passes along the intestinal canal without mishap an open safety pin does so with the spring foremost if however it makes its way point first it tends to be arrested by the point penetrating the mucous membrane of the stomach or duodenum At laparotomy the surgeon can sometimes close the pin through the unopened stomach and push it into the end of a stomach tube by which it may be withdrawn without performing gastrotomy An open safety pin in the duodenum has likewise been closed by palpation and has then passed successfully If a foreign body remains in one place in the intestinal canal for more than seven days surgical intervention should be considered

GONOCOCCAL MENINGITIS

Several instances of gonococcal meningitis have been recorded in the literature but in many of them the identification of the gonococcus has been so incomplete that pathologists may be pardoned for having been somewhat sceptical In a recent paper however from the United States by Dr Sara Branham and her colleagues[1] data are advanced which are likely to bring conviction to all but the profound unbeliever Dr Branham has for a long time been studying the meningococcus at the National Institute of Health in Washington and has acquired exceptional knowledge of this organism During the past two years no fewer than ten of the 500 strains sent to her for typing appeared to be not meningococci but gonococci It is true that they were agglutinated by polyvalent anti meningococcal serum and some of them especially well by Type II serum but their other characteristics left no doubt of their identity Special weight was attributed to the delicate nature of the growth and the smallness of the colonies on blood agar which differed from the relatively luxuriant growth and large colonies of the meningococcus Every one of the ten strains fermented glucose only whereas the meningococcus almost invariably attacks maltose as well The alkali solubility test of Thomson was found to be of definite though limited value Four of the ten strains were dissolved rapidly but the other six behaved like meningococci in being only partially soluble Serological tests proved very unsatisfactory for differentiation owing to the high degree of group affinity between the two organisms Five of the strains were isolated from the blood stream and five from the spinal fluid The full history of the ten patients could not be ascertained but it was established that in five of them at least the invasion of the blood or meninges followed gonococcal infection of the genital tract In two of the cases both of them in young women there was no history or evidence of genital infection and the meningeal or bloodstream infection appeared to be primary More recently three additional cases of gonococcal meningitis have been studied by the authors and in each instance previous genital infection could be proved There is of course no reason why the gonococcus which resembles the meningococcus in so many respects should not invade the meninges and the present paper leaves little doubt that it may do so It is of particular interest to note that in this series 2 per cent of strains supposed to be meningococci proved on further investigation to be gonococci The ordinary pathologist is content to make his report when he isolates from the spinal fluid a Gram negative coccus of typical morphology agglutinating with anti meningococcal serum In future he will have to realize that these criteria are insufficient to establish the identity of an organism and that a more thorough examination of the strain must be made if he is to avoid missing the occasional gonococcal infection

PERCUSSION OF THE HEART

Some careful observations by D Mainland and C B Stewart[1] show that percussion of the cardiac borders gives an appreciable error when compared with the radiographic picture The cardiac and superior mediastinal dullness was percussed out by an experienced physician in healthy young male students and in the fourth and fifth left interspaces the dullness was sometimes found lateral to the radiographic border by as much as 2 5 cm though the mean error was less than this a considerable error though in the opposite direction was also the rule in the fourth right interspace The inaccuracy in the most favourable circumstances thus demonstrated is of course increased under less favourable ones—for example in women and in those with thick chest walls and in the presence of emphysema The authors admit the defects of the method but think it should be cultivated for they describe a method by which an observer may determine the error of his own technique Percussion has been used particularly to indicate the position of the left lower contour of the heart if this extends much too far to the left the apex beat will usually be palpable and is then a more accurate guide If the exten-

[1] *Amer Heart J* 1938 15, 515

sion is moderate or slight and the apex beat impalpable percussion is surely too coarse a method to assess it The heart is a curved organ within a curved cavity, and between it and the surface there are tissues which vary in thickness from one individual to another, it is moved and altered in shape with each respiration and with each systole it moves as a whole in relation to its vascular pedicle and changes in size from the contraction of its chambers, it may also be displaced by gastric pressure and by change in the position of the body In view of these static and dynamic obstacles it would indeed be surprising if percussion had been shown to be accurate enough for that purpose for which it would be most useful—for example, the estimation of slight or moderate enlargement In the last few years cardiac percussion has been less and less relied upon, though there are some, including experts in the radiological method, who still think it valuable In general, however, it is being superseded by the x-ray method, which not only gives the most precise measurement of the heart size but detects local changes in areas inaccessible to percussion, the fact that, even after x-ray examination, it may still be doubtful in certain cases whether or not there is enlargement is no criticism of the accuracy of the method To the objection that x rays are not always available (for one reason or another) one may reply that it is better to be without them than rely on a method which is as likely as not to mislead If after inspection, palpation, and auscultation, and a search for signs of failure it is considered necessary to have more information on the size of the heart, then the time has come for radiography There are, however two conditions which may be discovered by percussion of the precordium—namely, pericardial effusion and pulmonary emphysema

"JACKET" RESPIRATOR FOR POLIOMYELITIS

The appearance in this country of acute poliomyelitis in the form of localized outbreaks occurring in centres considerable distances apart has focused attention on the available resources for providing artificial respiration by mechanical means There are at present about twenty Drinker respirators in London and the home counties of which one-half are the property of the London County Council, and two Bragg-Paul pulsators These machines have been made available whenever possible to the various public health authorities and hospitals which required them usually at very short notice Apart from the practical difficulties of transporting large pieces of apparatus which are liable to be damaged in transit problems in connexion with differences in voltage and character of electrical current will continue to arise until electricity supplies are standardized throughout the country As regards the respective merits of the respirator and pulsator, more experience of their employment in different conditions is required before a final decision is possible Theoretically the respirator is preferable as the mechanism of normal respiration—rhythmic production of intermittent negative pressure—is more closely imitated by this apparatus than by the pulsator but the experience of Dr C J McSweeney recently described in these columns [1] would appear to indicate that the objections to the latter have little validity in practice From the point of view of portability and cost, as well as of ease of operation and access to the patient for the application of splints and essential nursing procedures, the advantage lies with the pulsator, and mechanical defects of the earliest models have now been eliminated Both forms of apparatus have suffered from the disadvantage that only one patient could be treated at a time, although in the improved Drinker machines made in this country two or more cabinets could, if desired, be operated by one power unit This disadvantage became apparent early in the Victoria (Australia) epidemic of poliomyelitis in 1937, and Professor A F Burstall at page 611 of this issue tells how he was approached with a view to the construction of machines capable of providing mechanical means of respiration to several patients at once (six was selected as a convenient number from the standpoints of both engineering and nursing) So successful was the first model evolved in the short space of a week that in a few months thirty-five power units were produced, capable of operating two hundred cabinets in all The new "jacket respirator," as it is called, immediately interested workers in this country as it appeared to be convenient, economical, and practicable for the purpose It combines all the advantages of the respirator and pulsator and affords the additional advantage that multiple treatments can be carried out by means of a single power unit The disadvantages are that several sizes have to be made—at least three—for different sizes of patients and that the rubber used in the apparatus is liable to perish, whether in actual use or not Either positive pressure (pulsator) or negative pressure (respirator) can be used with the jacket respirator The Australian models have all been operated to produce negative pressure, and it is expected that this principle will be adopted here in view of the generally more satisfactory results of the Drinker respirator compared with other types of apparatus

PRINCE ARTHUR OF CONNAUGHT

Prince Arthur of Connaught whose death at the age of 55 took place on September 12, was for fourteen years chairman of the Middlesex Hospital In this post he followed the tradition of the Royal Family in maintaining a live and intimate connexion with the art and science of medicine and when he came back from South Africa in 1924 to take over the chairmanship of the Middlesex from Lord Athlone it was clear that he did not intend the position to be a nominal one Prince Arthur attended every board meeting of the Hospital nine or ten months of the year and served most energetically on the building committee He was the main spring of the effort that culminated in the complete reconstruction of the Middlesex Hospital His personal interest in the medical and nursing staffs made him in a real sense a "friend" of the Hospital The day after his death his coffin was placed in the hospital chapel there to remain in state until the funeral It was announced in the *Times* that Princess Arthur of Connaught wishes it to be known that a donation to the cancer wing of the Middlesex would be appreciated instead of flowers

SURGICAL PROCEDURES IN GENERAL PRACTICE

This is one of a series of articles contributed by invitation

AMPUTATION OF THE FINGERS

BY

HAROLD C EDWARDS, M S, F R C S

A conservative policy should be followed in dealing with the question of amputation of the fingers and thumb for the smallest portion of a digit that may be of value to the patient should be saved Such a policy is to be strongly recommended in connexion with injuries and particularly with injuries to the thumb It is surprising how pronounced is the power of recovery in the hand and immediate amputation is best avoided unless the finger is literally hanging by a thread Operation should be postponed until there is unmistakable evidence that the finger or a part of it will not survive Unless complicated by sepsis no set amputation should be done for such injuries but the doomed portion should be separated at the point at which the injury has ordained it and the flaps fashioned accordingly Further operative procedures should be postponed until the wounds are healed

In sepsis early amputation need be considered only when the infection has involved bone or joint and not when it is limited to the soft parts in which case it is wise to defer the question of amputation until the wounds have healed and the damaged finger has been afforded an opportunity to recover function Stiff and useless fingers may result from both injury and sepsis and form one of the most common indications for amputation Whether amputation should be done and if so at what level depends entirely upon the degree of usefulness of the finger affected

Fixed Finger

A fixed finger—whether fixed in extension like a poker or flexed up into the palm—is a worse than useless member Not only does it fail to contribute anything towards the work of the hand in general but it often exerts a malign influence upon the activity of its neighbours A poker finger may prevent the adjacent fingers from flexing fully and a permanently flexed finger may limit their powers of extending Of the two a permanently straight finger is the greater evil for it cannot fail to get in the way for whatever purpose the hand is used However with fixed flexion except possibly in the case of the little finger the hand will be the better for the loss of the affected digit and both fixed flexion and fixed extension therefore may be regarded as definite indications for amputation

In cases in which the flexor tendons are bound down by adhesions so that their action is greatly limited or totally abolished but in which the joints themselves remain supple so that passive flexion is possible amputation is not necessarily indicated In such cases the affected finger may be flexed into the palm by its neighbours and hence need not by its mere presence as a passenger impair the hand's efficiency to any appreciable extent The personal inclination of the patient himself should be studied before any decision to amputate is made The operation of Sterling Bunnell—that of substituting the disorganized tendons by free tendon transplants—may be worthy of trial in fingers so impaired although the results of such operations are not on the whole encouraging

Partially disabled fingers—for example those in which there is ankylosis only of one or both distal joints—are not usually so severe a handicap as to warrant operation but again it is a question of weighing up with the patient the relative advantages and disadvantages of retaining the finger and of partial amputation

Apart from injury sepsis and stiffness indications for amputation are rare and include a miscellany of unusual conditions—growth of bone tuberculous dactylitis in adults epithelioma and melanoma In cases of streptococcus infected puncture wounds of the finger pulp associated with septicaemia immediate amputation is sometimes advocated My personal view is that local excision of the wound is preferable It is to be hoped however that the use of prontosil and its allies will in the future obviate the need even for the less radical operation for these distressing cases

Some Anatomical Points

In connexion with amputations there are three anatomical points of surgical importance which need special mention

Position of Joints—The joints do not correspond with the prominences of the knuckles which are formed by the heads of the phalanges and metacarpals but are situated one twelfth one sixth and one third of an inch respectively distal to these prominences (starting at the distal joint) (See Fig 2)

Flexor Tendons—These are attached to the anterior surfaces of the phalanges by fibrous bands (vincula) and these tend to prevent the cut tendons from retracting (Fig 1) If the tendon be cut proximal to the middle

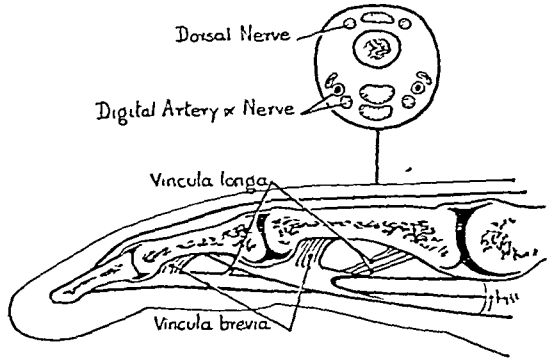

FIG 1—Diagram showing the arrangement of the vincula The smaller drawing is a cross section through the middle of the first phalanx to show the relation of the digital arteries and nerves

of the second phalanx the tendon is free to contract and in order to preserve movement at the first interphalangeal joint in amputation through the middle phalanx the flexor tendons should be held before division and stitched to the periosteum of the bone or over the end of the divided bone to the extensor tendons This precaution is not necessary in amputation through the first inter-

phalangeal joint because flexion at the metacarpal joint, and therefore of the resulting stump, is brought about by the interossei

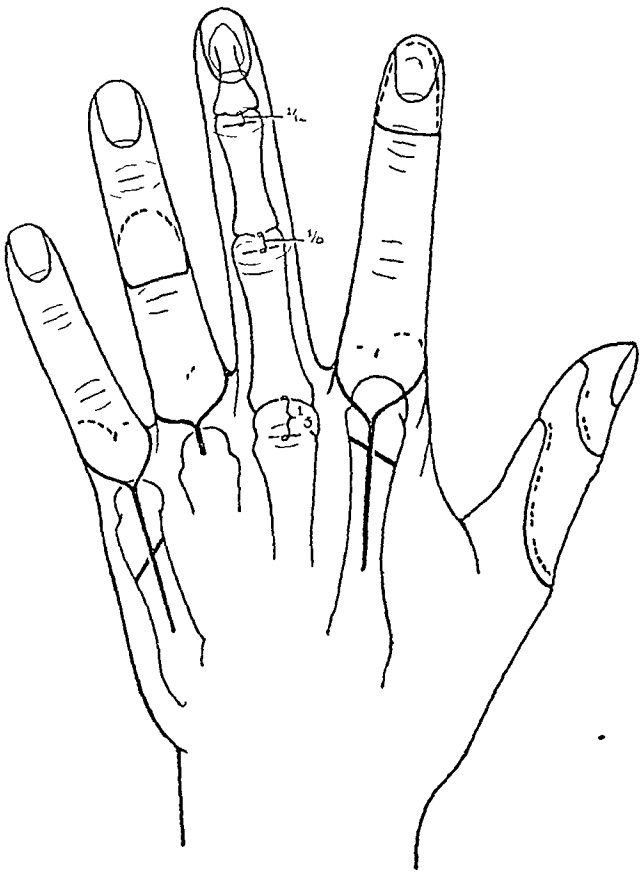

FIG 2.—Diagram showing incisions for various amputations described in the text and the relative positions of the joints

Position of Digital Nerves.—These lie on either side of the finger immediately in front of the digital artery, and both artery and nerve lie slightly anterior to the mid-plane (Fig 1). In amputations proximal to the second interphalangeal joint these nerves should be identified and divided as high up as possible.

Anaesthesia

Local anaesthesia is ideal for amputations distal to the root of the finger. A 1 per cent novocain solution is injected through a puncture wound on the dorsal aspect so that a collar of the anaesthetic is formed, encircling the base of the finger completely. About 3 c.cm. of anaesthetic should be sufficient, and to this should be added 3 minims of 1 in 10,000 adrenaline hydrochloride. Local anaesthesia may also be used for amputation at the metacarpo-phalangeal joint, but it will usually be found more convenient to do this operation under gas and oxygen anaesthesia.

Technique

In cases where the local condition does not permit of one of the set amputations—to be described subsequently—it should be borne in mind that if possible the long flap to be used to cover the end of the stump should consist of skin of the palmar surface. This flap will have greater tactile sensibility than one taken from the dorsum, and the resulting stump will therefore be of greater usefulness. The length of the flaps should be no more than sufficient to cover the end of the stump without tension, and the skin edges should be approximated accurately with interrupted stitches of fine silkworm gut. The flaps should be so fashioned that no corners are left on them which would result in an ugly or redundant scar. A tourniquet may be used, but it is unnecessary if a local anaesthetic is employed with adrenaline. If a tourniquet is desired in the more distal amputations a soft rubber tube tied tightly around the base of the finger will be found satisfactory. For amputations at the metacarpo-phalangeal joint a rubber tube tied tightly around the forearm will suffice, or, if it is preferred, a blood pressure apparatus around the upper arm. A firm bandage on an adequate covering of wool is used in order to diminish the tendency to the formation of haematoma. After amputation through one of the fingers a small wooden finger-splint should be used until the stitches are out, in order to obtain that rest which is so helpful to healing, but it should be discarded with the stitches, for its continued use will not only tend towards lack of mobility of the stump itself but will also affect the mobility of the neighbouring fingers, which readily become stiff in sympathy with their fellow.

Instruments.—A finger amputation set should comprise a narrow-bladed scalpel, two pairs of fine Spencer Wells forceps, one toothed forceps, a small bone holding forceps and a pair of fine bone cutting forceps, a small curved cutting edged needle, some fine silkworm gut, and a tube of 00 catgut, and for the anaesthetic a 5 c.cm. Record syringe and fine hypodermic needle.

Disarticulation at Distal Interphalangeal Joint of Fingers and Thumb

The end of the digit is grasped in the fingers and the joint flexed. A transverse incision is made on the dorsum at the level of the joint—that is, one twelfth of an inch below the prominence of the head of the second phalanx—and the knife passed right through the articulation. The knife is now turned at a right angle and an incision made towards the end of the finger so that a palmar flap of sufficient length is formed. The knife is turned again through a right angle to the palmar surface and the tip of the finger is cut through so that the distal phalanx with the nail-bed is removed (Fig 2).

Amputation through Middle of Finger

An anterior flap equal in length to the diameter of the finger at the point of section is marked out (Fig 2). The edges are rounded off and the flap, consisting of skin and subcutaneous fascia, is raised up. The tendons are divided, care being taken to fix the flexor tendons before the division is made. If the point of section is to be across the lower end of the second phalanx the flexor tendon is stitched to the periosteum or is cut of sufficient length to be passed over the end of the bone and stitched to the divided extensor tendon. The digital nerves on either side of the fingers are defined and grasped in Spencer Wells forceps and pulled upon, to be cut as high up as possible.

Disarticulation through the first interphalangeal joint is performed with a similar type of flap. In amputation here, however, the flexor tendons may be allowed to retract after section.

Amputation through Metacarpo-phalangeal Joint

The most useful incision in amputations at this level is a racket incision, with the handle on the dorsal aspect. The palmar aspect of the racket should be cut with a

notch so as to prevent a corner on the scar (Fig 2) In the case of the two central fingers the flaps should be of equal lengths but care should be taken to see that they are long enough to cover the head of the metacarpal bone if it is intended that this should be left There appears to be little truth in the contention that inclusion of the head of the corresponding metacarpal in the amputation occasions any added weakness of the hand, although on theoretical grounds this might seem to be the case The fact that the cosmetic result to be obtained if the head is removed is so much better than if it is left would outweigh any risk of weakness which experience has proved to be questionable—except perhaps in heavy manual workers in whom muscular strength is of far greater importance than the appearance of their hands If two adjacent fingers are to be amputated excision of the metacarpal heads is probably best avoided When either the first or the fourth finger is the candidate for amputation there should be no hesitation in removing the metacarpal head for the cosmetic result is vastly improved thereby In the case of the first finger moreover the removal will result in a more efficient hand In amputations of the first and the little fingers the racket incision should be so fashioned that there is a long flap on the exposed aspect—that is in the case of the index finger the outer (or radial) flap should be the longer and in the case of the little finger the inner (or ulnar) (Fig 2)

Amputations of Thumb

For amputation of the distal phalanx the method is similar to that of the fingers Amputation through the metacarpo phalangeal joint may be done either by a long flap from the palmar surface (Fig 2) or by a racket incision Amputation proximal to this point—that is, at the metacarpo carpal articulation—so severely disables the hand that it should be avoided if possible If the thumb metacarpal is so damaged that operation is essential, every effort to save the joint must be made for without it future reconstructive operations have very much less chance of a successful outcome In respect of this reiteration of the opening sentence of the article makes a fitting conclusion

---

H Servières (*These Paris* 1938 No 182) records seven illustrative cases of gonococcal septicaemia in patients aged from 19 to 28 three of whom were males and four females Two stages can be distinguished The first is a more or less latent period in which gonococci are present in the blood while the second is characterized by metastatic complications Of the numerous possible localizations of the gonococcus the following are the most important (*a*) joint manifestations of which the pseudo phlegmonous form and polyarticular rheumatism are the most serious (*b*) cardiovascular localizations (myocarditis and pericarditis are rare but ulcero vegetative endocarditis is frequent and the prognosis grave gonococcal arteritis and phlebitis sometimes occur) (*c*) nervous complications in which the spinal cord peripheral nerves, and meninges are affected (*d*) skin complications of which purpura is the most important (*e*) miscellaneous complications in which the liver, kidneys eyes, ears pharynx and thyroid are affected As regards diagnosis a search must be made for the gonococcus both in the genital organs and in the blood, joint fluids and cerebrospinal fluid As the presence of the organism in the blood is not constant repeated examinations must be made especially during the febrile period In addition to treatment by vaccines and serum the use of drugs such as the salts of acridine and mercurochrome is recommended

Correspondence

Convalescent Serum in Infantile Paralysis

SIR,—The statement of Drs Paterson and Critchley cited and traversed by Mr Girdlestone that we have no means of controlling the infection in acute poliomyelitis is surely at this date a truism that no one with any large-scale experience in dealing with the disease and no one who has kept in touch with the relevant clinical and experimental literature would care to dispute

And if it be accurate as I submit it is then it cannot be too widely known It is not right that the public should be led to suppose that we possess the means of scotching this dread infection or of mitigating or averting the development and severity of paralysis and that lack of medical enterprise in this country has failed to make these means generally and easily accessible when in fact no such means exist

A reading of certain past epidemics shows that unwise claims for the efficacy of serum treatment have prevented the making of the vitally necessary control observations since public opinion could not be expected to tolerate the experimental withholding of the vaunted remedy from any case for control purposes For this and other reasons serum treatment had been in use for over twenty years before the elementary scientific requirements of any just assessment of its value could be satisfied Of the quality of much of the evidence upon which the former belief in the efficacy of this treatment was based, Mr Girdlestone's own letter provides a fresh and illuminating example He writes My own experience with convalescent serum has been very happy though relatively small and without controls To speak of this as experience is surely to use the language of hyperbole It expresses simply an act of faith in which despite the disillusionments of the past quarter of a century, Mr Girdlestone hopefully asks us to join him

A remedy that is specific for a given infection reveals its specific potency rapidly as we have seen in the cases of salvarsan and sulphanilamide and does not need twenty five years extensive use to establish its value That after so long a period convalescent serum treatment should still find us wholly unable to claim that it has any value surely indicates that it has none and that the time for that hopeful suspension of cerebration euphemistically known as the open mind is past

In the circumstances neither the cause of medicine nor public policy is served by an attempt unsupported by any new evidence to revive that belief in serum treatment that still apparently lingers as a consolatory but obscuring superstition in the minds of those who cannot bring themselves to face the realities of a grim situation We all like to think that we bring healing in our hands but to attain this happy belief at the expense of the facts is to pay too high a price for it—I am etc,

London W 1 Sept 9 F M R WALSHE

Fracture of the Neck of the Femur

SIR,—I think the profession ought to be very grateful to Mr Nicholson for his most interesting account of his own experiences when suffering from a fracture of the neck of the femur

I only wish to comment upon two points One is the statement that the operation cannot be properly carried out

in fifteen minutes or less It is quite true that if all the preliminary adjustments and x ray investigations are made on the fracture table the whole procedure will probably occupy an hour or more This is no great drawback in a young and healthy patient but it is almost prohibitive for a feeble and frightened old lady I venture to suggest that for these patients the matter is much simplified by the whole procedure being performed in bed This means that the preliminary steps—namely, complete reduction of the fracture, x-ray films in two planes and the marking of the skin of the patient so that the exact points of application of the drill guide may be known—are all done at leisure in the days preceding the operation The sound side of the pelvis being tied to the head of the bed and the fractured limb with the knee bent over a pillow, fixed to the lower end of the bed by weight traction the patient is securely fixed as in a splint From the moment that the operation begins with the insertion of the drill guide until that in which the nail is driven home and the skin incision closed need not occupy more than five minutes We have become quite accustomed to the idea of inserting transfixion pins while the patient is in bed, and the same may be done with putting a nail into the neck of the femur if only the preliminaries are done at leisure beforehand

The other matter of which I was fully aware is Mr Nicholson's statement that the surgeons in voluntary hospitals in London have little experience in modern methods of fracture treatment, and that it is to the L C C hospitals that one has to turn in difficulties of this kind How much longer will it be that this state of affairs is to continue? Either the voluntary hospitals should have adequate fracture clinics of their own or for teaching purposes should be affiliated to one of the L C C hospitals —I am, etc

Bristol Sept 10 ERNEST W HEY GROVES

Tuberculosis Dispensaries or Chest Clinics?

SIR —I have read with interest the letter of Dr Philip Ellman (*Journal* September 10, p 593) The points he raises not for the first time, are of practical importance, but their significance has not been appreciated by the majority of the profession Of the hesitation on the part of numerous patients to attend these dispensaries, owing to the unfortunate stigma which they bear, most practitioners are aware Such hesitation is often reinforced by the attitude adopted by many employers of labour, who are still influenced by an erroneous conception of the pathogenesis of phthisis, which still lingers, even in the minds of the medical profession, as a relic of the teaching of half a century ago

We are an ultra-conservative nation and are loath to change the habits and even the phraseology adopted by our grandsires this, doubtless, accounts for our unwillingness to adopt the very sensible and practical suggestions urged by Dr Todd and Dr Ellman, whose reasons should be sufficiently obvious to influence even the most inert among the public health authorities In view of the advances made within the last few years in the organization of municipal general hospitals ante natal clinics and other forms of public activity designed to further the betterment of our race by means of adequate preventive measures it is surely not too much to hope that establishment of chest clinics on modern lines should remove the noxious stigma of the old tuberculosis dispensary and the prejudice which such a designation is calculated to create in the minds of all except the most highly educated patients

There is yet another good reason for this change, which has reference more to the doctor than to the patient The study of tuberculosis, like other specialties, suffers not a little from the evils of departmentalism In many institutions in which the treatment of this disease forms the main part of the work the minds of the medical staff become so centred upon the idea of tuberculosis that much sense of proportion is lacking and the relation of tuberculosis to general medicine is lost sight of It is largely for this reason that so many patients who have never in their lives suffered from tuberculosis continue nevertheless to spend a nomadic existence in and out of sanatoria at considerable expense to the public Such an abuse is, in these enlightened times, inexcusable Not only does it perpetuate the waste of public money, but it adds to the confusion which exists in too many minds between pulmonary tuberculosis and other forms of lung disease

It is time that we abolished the old-fashioned term "tuberculosis dispensary" and established the "clinic for diseases of the chest" Such a step would be in the best interests, not only of the patients themselves, but of the advancement of the science of medicine—I am, etc,

London, W 1, Sept 10 MAURICE DAVIDSON

SIR —Many people will agree with Dr Philip Ellman concerning the disadvantages of the term "tuberculosis dispensary' (p 593) His condemnation might with justification have included also the term "tuberculosis officer' which to some people conjures up a person vaguely linked with school or Poor Law "boards," whose sole function is with a stroke or two of the pen to whisk away their tuberculous patients to institutions in the wilds, to some of which (and at the same time to 'graduated rest and exercise") the pass is still a single "normal" temperature record at the dispensary At least, the patient would be whisked away if there didn't exist appallingly long waiting lists for most sanatoria But the term "chest clinic" also has definite disadvantages, and it is important that these should be recognized

(1) While admitting the argument of Dr Ellman in favour of "chest clinic," I suggest that the remedy is based on an unsound psychological principle I doubt whether it is of ultimate benefit to the patient to begin his "tuberculous career" with what is patently a subterfuge to his environment, and I doubt the soundness of a structure for a wide public health measure that is based on the ostrich policy (2) One cannot have a chest clinic merely in name, it must also be a chest clinic in deed Many tuberculosis officers neither have had the training nor have they the equipment at their disposal for investigating, diagnosing, and managing diseases of the chest other than pulmonary tuberculosis (3) A notible percentage of the patients seen by the tuberculosis officer suffer from tuberculosis of other organs than the lungs (4) It is still too seldom appreciated that tuberculosis of any part of the body is a systemic disease It is indeed this ignorance that is perhaps responsible for the difficulty experienced in finding an institution that is willing to admit or is equipped for treating a patient, for instance, who is suffering from active tuberculosis of a bone and pulmonary tuberculosis, or from tuberculosis of the spine and genito-urinary tuberculosis The need for treating all types and combinations of tuberculosis in the same institution should be urgently brought to the notice of authorities who are planning new hospitals or sanatoria for the treatment of the disease

What then is the solution? Failing education of the public to recognize that disease is not a stigma the difficulty can be got over by concentrating several clinics in

one building (as is already being done) containing tuberculosis, maternity and child welfare school food dental clinics etc, and calling the building health centre municipal polyclinic or some similar name Where one building must continue to serve for the tuberculosis work alone chest clinic (and physician to the chest clinic) would appear the only way out at present but it should be recognized as a *pis aller* and as a stimulant to the further development indicated above—I am etc

Staines Sept 11 G GREGORY KAYNE

Fractured Olecranon Personal Experience

SIR—In the *Journal* of September 10 (p 590) Sir William Wheeler writes I hope we will have further opportunities to study the comments of patients who belong to the ranks of the medical profession

In the *Journal* of July 30 Mr S L Higgs in his article on fractures of the olecranon says on page 232 Bony union will not be secured but nevertheless a remarkably useful arm may result from a fibrous union with separation of the fragments

In April 1897, I was knocked off my bicycle and fell on the stone sets and my left olecranon received the full force of the blow I treated it with a long anterior splint and a pad above the break with traction to the end of the splint in spite of advice from many of my surgical friends to have passive movement to prevent adhesions my elbow was not bent for six weeks as my firm belief was and still is that with a fracture into a joint the best way to get adhesions is to move the joint After the splint was removed I began to bend and use the arm with firm bony union I was insured at the time and received six weeks total and one week partial compensation I got and still have 100 per cent result If this result could be obtained forty one years ago why not now?

I enclose x ray photographs One I took within a few minutes of the accident and before a splint had been applied, and the other just recently—I am etc

St Helens Sept 10 R JACKSON

Carbohydrates and Alimentary Disease

SIR—The comparative rarity of appendicitis colitis and haemorrhoids in the Rhodesian aborigine living in a natural state and the marked frequency with which these conditions occur in the Europeans in Rhodesia coupled with the fact that the sites affected are associated with the collection and expulsion of the waste products of ingested food, suggested that an examination of the dietaries of the two races might explain the difference in the incidence of these diseases in these peoples A comparison of the respective dietaries indicated that the natives subsist mainly on cereals meat green and root vegetables, and sour milk whereas the Europeans in addition to cereals meat and vegetables consume large amounts of refined sugar fruit, and fresh milk Having concluded that the latter foods probably bore some relation to the diseases peculiar to the Europeans I proceeded to inquire into the manner in which these foods might produce pathological changes

An examination of fifty eight stools from cases of haemorrhoids was made on the assumption that fermentation of the sucrose in the food the laevulose and dextrose in fruit or the lactose in fresh milk might be responsible Of these fifty eight stools fifty five proved to be acid in reaction A similar number of native stools taken at random were all strongly alkaline in reaction In order to determine which of these sugars was responsible for the acidity of the faeces it was decided to eliminate each in turn from the dietaries of these cases Within twenty four hours of excluding sucrose the reaction of the stools in all cases had become alkaline Since sucrose appeared mainly responsible for the acidity of the faeces in these cases an estimate of the amount necessary to produce such acidity was now made Ten cases of piles of several years duration whose stools had been rendered alkaline for over one week were given increasing amounts of sucrose daily 3 to 5 oz of sugar were found to cause acidity of the faeces in different subjects The reversal of the faecal reaction was associated with a marked aggravation of the patients symptoms

In order to confirm these findings experiments were conducted on a patient with an appendicostomy This operation had been performed in order to effect lavage of the colon in a case of severe ulcerative colitis of ten years duration The patient was at first given the diet to which she was normally accustomed The reaction at the appendicostomy opening was consistently acid Within twelve hours of eliminating sucrose from the diet the reaction became alkaline and remained so during the period of abstinence from sucrose Sucrose was now given in increasing amounts and when the daily consumption reached 4 oz the intestinal reaction became acid Withdrawal of sucrose caused a further reversal to alkalinity within twelve hours Laevulose was now added to the diet of this patient After the ingestion of only 14 drachms over a period of twelve hours the intestinal content gave an acid reaction which persisted during the exhibition of this amount daily The administration of dextrose lactose and maltose in amounts up to 6 oz daily did not cause acidity of the faeces but resulted in diarrhoea During the period when all sugars were excluded from the diet the patient was remarkably free from symptoms The exhibition of sucrose and laevulose however caused a pronounced deterioration in the condition of the patient even before the intestinal contents had become acid

To determine whether acidity of the intestinal contents and appendicitis bore any relation to each other the proximal end of a series of appendices removed at operation were examined and the following results recorded

Group 1—8 cases operated on within twelve hours of onset all acid

Group 2—15 cases operated on after twelve hours 5 acid 10 alkaline

Group 3—12 appendices removed during the course of other operations and all apparently normal in appearance all alkaline

The alkaline reactions in Groups 2 and 3 were attributed to the small intake of sugar during the period before operation The effect of sucrose on infants was determined by giving 1 drachm four times daily to twenty native piccaninnies (aged 1 to 3 years) who had never consumed this sugar and who had never had colitis or diarrhoea Within one week four children had developed colitis with sour acid stools and as three of the cases proved very severe the experiment was discontinued An examination of the stools of twenty five European infants suffering from colitis indicated that only four had stools alkaline in reaction Two of these cases were proved to be of amoebic origin and the remaining two were attributed to excessive amounts of lactose in the diet In all cases where the stools were acid the infants were being given sucrose in their artificial foods

Twelve cases of ulcerative colitis in European adults in whom severe third degree haemorrhoids co existed were found to have stools which were acid in reaction whereas in twenty-five less severe cases the reaction of the stools varied from day to day The amount of sucrose normally consumed by these patients varied from 2 to 6 oz daily The effect of laevulose was determined on ten cases of haemorrhoids In all cases the exhibition of 3 oz daily caused the stools to remain consistently acid During the course of the observations the following points were noted

1 Native stools were invariably alkaline in reaction well formed of considerable diameter and bulk and containing no grossly undigested food

2 Stools from cases of colitis and haemorrhoids were invariably acid in reaction badly formed small in bulk and imperfectly dehydrated and the more severe the case the

smaller was the diameter of the stools which usually contained much grossly undigested food

3 Radiological examination in cases of colitis shows a diminution in the diameter of the descending colon and loss of haustration The colon as a whole is prolapsed and elongated

4 Haemorrhoids of all types are associated with some degree of colitis and, generally the more severe the colitis the more pronounced the piles

5 Prolapse of haemorrhoids occurs when flatus or a plug of mucus or faeces is present in the rectum When the bowel content is consistently acid the piles tend to protrude more readily and though the rectum is emptied the masses still tend to protrude even after replacement

6 The level of the anus in natives is much higher than in Europeans suffering from haemorrhoids even when the latter are not protruding

7 Laxatives have a pronounced effect in aggravating the symptoms in cases of haemorrhoids and frequently precipitate an attack of appendicitis

8 The faeces may be acid in reaction in subjects on a sugar free diet when ingested polysaccharides are permitted to remain in the bowel for thirty-six hours or longer

It should be noted that all sugars have a laxative effect dextrose being no exception Lactose would appear to have the most pronounced action in this respect and it is interesting to note that natives when questioned regarding their preference for sour milk indicated that fresh milk taken in amounts necessary to meet their requirements when other foods were scarce caused diarrhoea Fruit and honey were consumed in only small amounts for the same reason

The relation between appendicitis and cane sugar consumption will be seen to be particularly significant when one compares the increase in the incidence of this disease in the United Kingdom with the increased use of cane sugar The first cases of appendicitis were reported in England about 1880, after which time the incidence of the disease rapidly increased In 1844 the sugar consumption in the United Kingdom averaged 18 lb a person per annum In 1860 the figure was 35 lb In 1880 the amount was 60 lb and at the present time is well over 100 lb a person per annum It will be seen that when the sugar consumption in Britain averaged between 2½ and 3 oz daily—slightly less than the amount usually required to render the intestinal contents acid—appendicitis became a surgical entity An examination of the statistical returns in Southern Rhodesia shows that the consumption of sucrose by the natives of this territory averages about 13 lb per annum

When it was concluded that foods containing sucrose, laevulose and lactose were responsible for the conditions peculiar to Europeans it was decided to treat all available cases of colitis and of haemorrhoids, and cases diagnosed as of chronic or subacute appendicitis, by providing a diet based on that of the natives The following foods were permitted Porridge (any cereal but oatmeal to be preferred) Meat, fish, fowl, eggs Cabbage cauliflower spinach, and lettuce Peas, beans, carrots, turnips and potatoes Sour milk butter, cheese and cream Fresh milk (not more than half a pint daily) Bread (preferably wholemeal) Cakes (sugar and syrup free) Alcohol (spirits or beer) Tea and coffee

It was specially emphasized that sugar syrup, honey, and fruit should not be taken and the use of laxatives was discouraged In the early stages of dieting when bowel function caused trouble warm normal saline enemata or small doses of milk of magnesia were recommended The effect of this diet on the cases will not be considered in detail, but it may be mentioned that in mild cases of second and third degree internal haemorrhoids of many years duration where there had been no history of thrombosis the results were almost spectacular Ten cases of severe ulcerative colitis, thirty two of haemorrhoids, and twenty diagnosed as cases of chronic appendicitis were completely relieved of their symptoms in three to six months and showed no sign of recurrence over periods varying from three months to two and a half years In many cases it was found that conditions other than those for which the treatment had been initiated had been relieved or cured. Mention might be made of acne, dermatitis, vomiting of pregnancy, persistent headaches nasal sinusitis and one case of monilia infection of both hands which had resisted all forms of treatment for two and a half years—I am, etc,

Umtali, Southern Rhodesia August 26 ANDREW BROWN

Undescended Testicle

SIR—I thought I had finished with this correspondence, but I should be most sorry to leave Dr P M F Bishop (*Journal* September 10, p 594) with the impression that we disagree My main contention was that there have been gross errors of observation in deciding what an 'undescended testicle' actually is I gather he agrees with this Another was that hormone treatment will never bring down a testicle that would not in time have descended without it in other words, that the 70 per cent of cases in which it will be successful is the same as the 70 per cent of cases in which descent will spontaneously occur before growth is complete, and also the same as the 70 per cent which fall into my two retractile classes He has not commented on this, and as the point is not without statistical importance I think silence must mean consent

Again, we both hint that gonadotropic hormones should be used with some care I presume that the dangers we have in mind are much the same To take only one direction in which they lie, E T Engle (1932) states that "the only uniformity of agreement of investigators on the response of the male genital system to anterior lobe extracts or to those of prolan is that the animals which have been treated do not mate" This is preceded by a long list of German workers who have found hypertrophy of the interstitial tissues and degeneration of the germinal epithelium in the testes after injections of such female urinary extracts into male experimental animals For instance 'Kraus (1930) has suggested that the primary change in the testis after prolan treatment is the hypertrophy in the interstitial spaces, and that the degeneration of the tubules is due to a pressure atrophy' (I am sorry that all German authorities seem to repeat my mistake of talking of the gonadotropic hormone by a trade name, prolan instead of pregnyl) Dr Bishop would probably be interested in a boy I have just seen who after such injections has a hypertrophic penis and tiny, soft, insensitive testes There is a disturbing resemblance to the result of orchitic mumps, in which also a high cellular pressure must be set up inside the gland

Our final point of agreement is on my complete lack of any authority in discussing hormones Of course a carefully prepared position entails a certain amount of reading, but this reading is apt to lead one into errors For instance, my use of the plural in talking of growth hormones was due to my trust in certain printed statements that pituitary secretion actually would produce the skeletal hypertrophy to which I referred, but only in combination with thyroid—I am, etc

Engle E T (1932) *Sex and the Internal Secretions* Ed 1 by Edgar Allen Williams and Wilkins, Baltimore

The Harris Prostatectomy

SIR,—Mr Kenneth Walker has made a most admirable survey of the present position of treatment of the enlarged prostatic gland (*Journal* July 9 p 53) In one section of his article his remarks are misleading in that he has confused the results achieved by the Harris operation as practised by the late Harry Harris with those of surgeons who have made original alterations to the technique Those of us who have conscientiously tried to follow the precise details of technique which Harris described have usually approached his mortality rate Possibly his achievement was partly due to the ideal surroundings in which he worked—which cannot always be imitated My observations lead me to believe that the more his technique is varied the greater will be the deviation from the high standard set by his results With regard to the incidence of pelvic cellulitis I have seen this only once in well over two hundred cases On this occasion a prostatectomy was undertaken on a patient with a carcinomatous prostatic gland because of an error in diagnosis There is no doubt that the periprostatic tissues were opened during the enucleation in this case

Post operative investigation has proved that several theoretical fallacies in the Harris procedure do not exist in actual practice and the rarity of this complication—pelvic cellulitis—suggests that it is not due to any inherent weakness in the technique It would be more helpful if in discussions on prostatectomy, the true Harris operation was more clearly differentiated from the near Harris operation—I am etc

Sydney Australia August 25 COLIN EDWARDS

SIR,—I should like to congratulate Mr Kenneth Walker on his otherwise masterly survey of prostatic enlargement and its treatment (*Journal* July 9 p 53) but I cannot let pass without comment his references to the operation described by my brother the late S Harry Harris of Sydney Australia Mr Walker's description of the operative technique while necessarily brief is substantially accurate except in his allusion to the lateral sutures to draw together the walls of the cavity and to help to obliterate it The two sutures employed for this purpose should be described as transverse sutures, inserted into the anterior segment of the residual prostatic cavity—the first and uppermost in a plane tangential to the upper rim of the cavity, the second bisecting and passing deeply into the lateral margins and skirting but not including the floor of the cavity

Since the Harris technique was instituted in 1927 I can recollect no case of pelvic cellulitis occurring either in my own practice or in that of my late brother which could in any way be attributed either to the haemostatic, or lateral, sutures, or to the plastic sutures—the postero median retrigonization suture and the anterior transverse sutures nor have I heard of any such reports from those urologists and general surgeons who have been employing the method in Australia While it would be idle to deny the theoretical possibility of infection the only cases that have come to my notice have undoubtedly been due to the opening of tissue planes which should not have been entered This has been brought about by perforation of the fascia of Denonvillier during enucleation or by removal of the verumontanum and proximal urethra in the course of a Freyer or some similar type of prostatectomy Further in personal communications Mr Walter Galbraith of Glasgow and Professor Hryntschak of Vienna, among others, have expressed themselves as highly satisfied with their results

I would emphasize the fact that both these gentlemen were rather extensively coached by the late S Harry Harris in his methods of aseptic and antiseptic preparation (the importance of which is apparently still not fully appreciated) and in his technique and post operative care they have not seen fit to depart except in most minor detail from the originally described technique I can only attribute any unsatisfactory results in view of my own extensive experience of the operation to the modifications which have been introduced Surely it is unjust and unsound roundly to criticize and condemn a technique which has been so modified and emasculated that the methods practised bear little relation to those originally described If surgeons abroad would only familiarize themselves with the technique described by S Harry Harris I am certain that his remarkably low mortality rate would be reproduced It has been stressed repeatedly that the Harris procedure is not an operation for the occasional prostatectomist—I am etc

Sydney Australia August 22 RICHARD G S HARRIS

The Neglect of Galvanism

SIR,—In the August issue of the *American Journal of Roentgenology* (p 236) there is reproduced a radiograph of the lumbar vertebrae of a patient suffering from syringomyelia of Morvan's type Looking at this illustration one cannot help being impressed by the close resemblance between this film and films of the lumbar vertebrae of patients with chronic arthritis of the hypertrophic type The unavoidable inference is that in these cases the similar x ray appearances are the results of a similar cause—a trophic nerve inhibition This is not the only evidence that chronic arthritis is often dependent upon a nerve lesion in cases of chronic arthritis of the knee joint every physician must be familiar with the patients whose lower limbs are letting them down the motor as well as the trophic fibres in these cases being obviously affected

Fifteen to twenty years ago it was a common practice to treat these cases of chronic arthritis by ionization with large electrodes using a considerable current for about an hour In my experience the effect of this treatment was permanently to relieve the symptoms in almost every case A reasonable explanation of the permanency of these results is that they were due to a restoration of the normal influence of the nerve supply to the affected joint the long electrodes used bringing a still greater length of nerve under the influence of the galvanic current A trophic nerve inhibition would involve the trophic fibres of the nervi nervorum thus creating a vicious circle If a galvanic current temporarily replaced the lost trophic nerve influence it would be reasonable to expect that the vicious circle might be broken and complete recovery follow Whether the introduction of ions of suitable drugs accelerates recovery is doubtful but one may as well use sodium salicylate or other drugs in solution as common salt the additional expense being negligible

As regards the efficacy of the galvanic current using salicylic acid ions in the treatment of neuritis Wullyamez of Lausanne in 1911 reported eighteen complete successes out of twenty patients the remaining two showing considerable improvement During my first two years in the Army 1915 and 1916 I treated seven cases of sciatica by this method five with complete success the two unsuccessful cases were suspected by the medical officer in charge of their ward of being malingerers Six cases of brachial neuritis were treated during the same period with complete success Treatments were given three times a week and the average number given for sciatica was six,

and for brachial neuritis ten so good results were quickly obtained With cases of chronic arthritis relief is obtained almost as rapidly Nowadays I am often asked to make x ray examinations of the joints of patients suffering from neuritis or chronic arthritis but so far as I can ascertain treatment of these conditions by this rational and successful method is now hardly ever given a trial—I am, etc,

Chingford September 5 WILFRID GARTON

Treatment of Typhoid Fever by Sulphanilamide

SIR—In a leading article in the *Journal* of May 21 (p 1109) it is suggested that 'another remedy which seems to merit more attention is sulphanilamide This drug has a curative action in typhoid infection in mice comparable to that in streptococcal infections The following case of typhoid fever treated by sulphanilamide seems worthy of record

I was called on to attend a youth of 16 who had had fever and backache after playing tennis in hot sunshine On examination the skin was dry and hot the face was flushed and the conjunctivae were slightly congested His temperature was 102 F his pulse and respiration rates were 108 and 28 a minute respectively There was nothing abnormal in the circulatory and respiratory systems The spleen was enlarged tender and just palpable Examination of the blood revealed no malarial parasites but there was definite leucopenia (3,200 white cells per c mm) with a fall in the proportion of polymorphonuclear cells Blood culture on the fifth day yielded a pure culture of *B typhosus* One tablet of proseptasine was administered every four hours followed after one hour by 10 grains of potassium citrate in water Haliverol, bemax and plenty of orange juice were also given Only a liquid diet was allowed throughout the course of the disease Two days after the first administration of sulphanilamide the patient's temperature began to fall It became normal on the eighth day (twelfth day of the disease) and thereafter remained so

—I am etc,

Vizagapatam, S India, August 25 K V SUBBARAO

The Occipito-posterior Case

SIR—As I have used chloroform anaesthesia and instrumental delivery in the large majority of my confinement cases for thirty-five years unaided, perhaps I may be allowed to assume that I am one of those 'self-taught in the rough school of actual practice with full responsibility I have never once regretted using forceps and chloroform in any case where pains are regular—I do not say good—and no advance is perceptible in half an hour even though full dilatation has not obtained Of course rhythmic gentle tractions have to be made until this full dilatation does obtain to deputize for the function abolished by the anaesthesia When the cervix has retracted beyond the head traction then falls into two categories (1) the advancing, as if against elastic resistance and (2) the 'no good, as if up against a stone wall This last is in nearly every case due to non rotation of the occiput forward, and having embarked upon an artificially assisted delivery we must help it round

Until four years ago I rotated with Barnes's forceps with a wide sweep in whichever direction was the easier until the handles lay right back over the perineum removed the blades and reapplied them in the opposite direction In spite of the nurse's pressure of the infant into the pelvis this was by no means always successful I therefore devised the hinged instrument that enables us to swing the handles forward—thus reversing the pelvic curve—and proceed to extraction sometimes of course prolonged in the case of a primipara but often with the next traction without removing the instrument I have now details of forty cases in which rotation was performed in this way Application is easy when the new sensation of having a movable blade against the fingers in the vagina wears off The blades find the path of least resistance to the robust maxillary region whether transversely or obliquely placed because they are hinged Those who prefer the mother on her left side as I do, can introduce the second blade as a straight one (with no pelvic curve), which obviates hauling the maternal buttocks over the edge of the bed so that the handle can be sufficiently depressed

With the blades locked I believe that I can now diagnose an occipito posterior position by its stone wall' refusal to advance upon traction 'If this occurs I press the head upwards and rotate it in the direction of least resistance The handles are swung forward and a gratifying feeling that now it will come means a successful manœuvre If the no advance feeling still obtains my whole hand goes in and the occiput is located I could press it forward, but I prefer to reinsert the straight forceps blades to do this to rotate more firmly with knowledge gained, and by swinging the handles forward to produce the pelvic curve and extract with confidence In none of my cases has the child's head shown any forceps mark or pressure sign

One more point concerns the aftercoming head I have always found the rigid Barnes's blades difficult and dangerous to pass, but the hinged blades recently slipped easily into position and a rather important 9 lb first baby was extracted with a firm pull, alive and hearty, I admit that the perineum suffered—I am, etc

Castle Cary, Sept 11 DAVID PRICE

"Tetanus from a Cancer Cure"

SIR—In the *Journal* of May 7 (p 1013) there is an annotation, 'Tetanus from a Cancer Cure," containing statements and implications which need to be corrected in fairness to yourself and your readers In the first place the solutions under investigation have never been styled a 'cancer cure' either by myself or anyone associated with my work This research has been conducted upon a conservative ethical basis Solutions have been supplied, without charge, to about six hundred reputable physicians who applied for them for use on their patients at home, with the single request that short case histories and progress notes be returned for our records The Foundation clinic is free Expenses have been met by private money The research has been upon advanced cancer patients who had received all possible benefit from surgery and radiation and then been abandoned as hopeless and about to die

The second error is in your statement that eleven deaths have rapidly followed injections of some of this material The material in question was not from our laboratory or of the same nature as that made here Official investigations and inspections by authorities from Washington and Ottawa proved that to be the case and it was so declared publicly Unfortunately a denial or correction of such a statement never travels as fast or is far as the original false and damaging accusation If you wish to do so you can readily secure the official report from Washington as to the source of the lethal material the nature of the mistake, and the cause of the deaths You add 'This was a danger obviously to be feared from such a product That is equally true of many biological and other products in common use but does not justify a repudiation of their value In our case however it must be acknowledged that due care has been taken since upwards of fifty thousand injections of these filtrates produced in our laboratory have been given to patients and no harmful reaction has been seen or reported from any one of them

You further say that the account given of the conditions under which the product has been manufactured is far from reassuring I have not seen the account to which you refer but Government inspectors from Ottawa and Washington made very few suggestions for changes in the laboratory or process The last inspection made by an official of the Department of Health at Ottawa found that all Government standards and requirements were in force and it was so reported Last February I had made a formal application to the Department of Health at Washington for an inspection of the laboratory but no action was taken upon it until after the publicity from the accident mentioned Everything possible is done to ensure the safety of these biological products made under a personnel approved by Canadian Government officials

You continue your comment by adding that while the disaster had no bearing whatever on the possible usefulness of the treatment properly applied and safeguarded it will doubtless and rightly serve as a setback to the indiscriminate application of treatments which have been insufficiently tested and are not under adequate control The implication is unfair and unwarranted so far as my work is concerned Treatment of patients in this research has been properly carried out under supervision of expert and experienced consultants There has been no indiscriminate application of treatments they have been sufficiently tested and are under adequate control It appears that anyone who undertakes cancer research and combines laboratory and clinical experimentation is immediately under suspicion by the organized medical profession and the mandarins of the medical press and certain to be condemned and derided However if there is merit or truth or value underlying such research it will survive all attacks—I am etc

Wanted Surgical Instruments for China

SIR—I am very interested in the relief work that is being done in connexion with the Lord Mayor of London's fund for the relief of distress in China and for the hospitals working in China I am anxious to collect surgical instruments and apparatus from various hospitals and surgeons for which they have no further use All that are worth reconditioning will be put in order in Sheffield and sent out to China If any of your readers have any surplus or unwanted instruments will they please dispatch them to me at Clyde Steel Works Sheffield marked China Relief

The need is very great and through the good will of various people transport will be arranged without any charge being made—I am etc

Sheffield September 2 FRED M OSBORN Vice Chairman of the Sheffield Committee

Rheumatoid Arthritis and Jaundice

SIR—Some of your correspondents seem to think that the jaundice had some curative effect on the arthritic condition It ought to be made clear that such is definitely not the case Virtually every case of arthritis deformans has a complicating gastro enteritis as part of the vicious circle Reaction to an antigen of the causative microbes produces temporary blocking of the bile duct in some few cases with consequent jaundice In Dr G Laurence's case (*Journal* September 10 p 592) the gastro intestinal infection was a *Staphylococcus aureus* streptococcus and *B coli* combination The direct microbial causes of the arthritic condition are excreted into the urine from the blood by the kidneys from which they can be isolated Invariably when there is effusion such microbes can be precisely isolated from the clear generally reported sterile fluid of the joint In this case there was a *Staphylococcus albus* and diphtheroid bacillus combination Complete restoration to health in any case of any kind can only be secured by specifically treating all the infections present in the body The disappearance of osteophytes and the replacement of the destroyed articular cartilage by some substitute tissue the nature of which has not yet been ascertained has to be experienced to be believed—I am etc

London N W 1 Sept 9 W M CROFTON

"A Mere University"

SIR—I can assure Sir Ernest Graham Little and Dr Major Greenwood that I had neither intention nor desire to be sneering or contemptuous about the University of London for I agree that its foundation brought higher education to large sections of the community then debarred from admission to the older Universities by sex creed or race My own father graduated at London in 1851 when as a Nonconformist he would have been unable to obtain a degree elsewhere in England Nor had I any intention of making unfavourable comparisons with Cambridge No Cambridge man can view with pride the state of medical education there when London University was founded and it is obvious that the standard then set had a most beneficial effect in raising standards elsewhere

The head and front of my offending appears to have been the use of the words mere and incredible The Oxford English Dictionary gives as the first definition of mere—pure unmixed undiluted and its subsequent definitions are as free from a note of contempt as I intended my use of the word to be But it is quite clear that though the attitude [of London University] towards examinations has in no way changed the reconstituted University realized that examinations in themselves are not enough In the retrospect an attitude may appear incredible which at the time was the only possible one To say that the advance made by London University in its first century of existence is almost incredible would be to state a fact that has no sinister connotation

May I remind Sir Ernest that the would be destructive criticism of examinations was not mine but came from the pens of a past and a present official of London University I merely attempted some constructive suggestions to diminish the serious chance of fallacies in the system to which they called attention—I am etc

Universities and Colleges

UNIVERSITY OF CAMBRIDGE

J T Irving M D of Gonville and Caius College has been appointed university lecturer in physiology for three years from October 1 1938

A R H Trim B A of Trinity College has been appointed to the Benn W Levy research studentship in biochemistry 1938-9

UNIVERSITY OF MANCHESTER

Dr Benjamin Portnoy has been awarded the Dickinson Travelling Scholarship in Medicine

Obituary

SIR ROBERT HENRY WOODS, M B, M CH
FRCSI FACS (Hon)
Honorary Professor of Laryngology and Otology, Trinity College Dublin

We regret to announce that Sir Robert Henry Woods died suddenly on September 8 at his residence Marino, Killiney Co Dublin Although he was in his seventy-fourth year he appeared to be in vigorous health and was still in active practice His passing has robbed Ireland of one of her most distinguished sons, the medical profession of a laryngologist of outstanding skill and ability, and his colleagues and patients of a most loyal and trusty friend

Robert Henry Woods was born at Tullamore on April 27 1865 He was the youngest son of the late Christopher Woods, and was educated at Wesley College, Dublin the nursery of many a famous Irishman Later he entered Trinity College, Dublin, where he had a most distinguished record In 1889 he graduated B A with the first Senior Moderatorship in Experimental Science, being awarded the Large gold medal His medical record was equally successful In 1889 he qualified M B B Ch, B A O, and the year after qualification he won the surgical travelling prize, which enabled him to proceed to Vienna for a postgraduate course of study in laryngology and otology the branch of the profession to which he devoted nearly fifty years of his busy life Soon after his return from Vienna he was appointed laryngologist to the Richmond Whitworth and Hardwicke Hospitals where he was a colleague of the late Sir Thomas Myles with whom he made a lifelong friendship Subsequently he resigned his appointment at the Richmond Hospital on being elected the first laryngologist to Sir Patrick Dun's Hospital Here he organized a new department to which he devoted much time and care Sir Robert was the first specialist in Dublin to confine his attention to diseases of the ear, nose, and throat, his predecessors being general physicians, surgeons, or ophthalmologists who practised laryngology or otology in addition to their ordinary work On retiring from the active staff of Sir Patrick Dun's Hospital in 1935 he was appointed consulting laryngologist and was succeeded by his son Dr R R Woods

Sir Robert Woods was an able and adventurous surgeon who was possessed of wonderful dexterity and resourcefulness He inspired great confidence in his patients and as a consultant his advice was widely sought His reputation passed far beyond his own country as was exemplified in 1923 by the conferment upon him of the Honorary Fellowship of the American College of Surgeons At home he was the recipient of many honours In 1911 he was elected President of the Royal College of Surgeons in Ireland In 1913 he was created a Knight and in the same year Dublin University conferred on him the honorary degree of M Ch During the four years 1918 to 1922 he represented Dublin University as M P at Westminster, succeeding the late Lord Carson Trinity College appointed him Honorary Professor of Laryngology and Otology in 1915, the duties of which office he performed until his death Sir Robert was President of the Dublin University Biological Association in his younger days, and at one time was President of the British Laryngological Society He was selected as President of the Irish Medical Association by the medical profession of Ireland When the Royal Academy of Medicine of Ireland instituted the new Section of Laryngology and Otology Sir Robert Woods was the obvious man to become its first president, and was duly elected At the Annual Meeting of the British Medical Association in Dublin in 1933 he acted as president of the Section of Laryngology and Otology, having served as vice president at previous Annual Meetings in 1901 and 1902

This multiplicity of duties, coupled as they were with a busy practice, did not, however, prevent Sir Robert from energetically pursuing interests in other fields He had many hobbies, and exemplified the truth of the saying that a busy man can always find time to do something else He took a keen interest in the Royal Zoological Society of Ireland, of which he became president When he paid a visit to his barrister son in the Far East he returned with a collection of animals which he presented to the Dublin Zoo Sir Robert was an amateur carpenter of no mean order, and could revel in working a lathe and in making his own instruments He could equally well weave a luxurious carpet on a loom As a connoisseur of pictures and antique furniture he was an acknowledged master, having made a rare collection His knowledge and appreciation of good music was recognized at the Royal Dublin Society and at the Catch Club and 'Strollers Club' His writings were not numerous, but when he wrote the substance of his theme was always characterized by original thought and matter, as, for example, his article on malignant granuloma Although he had no great powers of oratory Sir Robert was a most excellent chairman, and always brought to bear a fund of sound common sense and well considered judgment on any subject under discussion Although not able to brook fools gladly he was essentially fair-minded and most tolerant of other people's opinions, even when they did not coincide with his own Personal enmity was foreign to his nature, and he was a staunch friend to those in difficulty He was generous and even lavish in his giving in any cause which interested him, as was the case when he became chairman of the Endowment Fund of Trinity College

In 1894 he married Margaret, only daughter of the late Judge J J Shaw, K C, Recorder of Belfast He lost one son in the war, and is survived by two sons and two daughters and by his widow

WILLMOTT HENDERSON EVANS, M D F R C S
Consulting Surgeon to the Royal Free Hospital

We regret to announce the death on September 7 at the age of 79 of Mr W H Evans, who was consulting surgeon to the Royal Free Hospital and to the Hospital for Skin Diseases at Blackfriars The third son of the late Dr Evan Evans, R N, Mr W H Evans was educated at University College London, and received his medical training at University College Hospital After taking his B Sc Lond in 1880 he took the diplomas of L S A and of M R C S in 1883 In 1885 he took his M B, B S and proceeded to the M D in 1887 being

elected F R C S in 1890 Mr Evans was a demonstrator in anatomy at University College was surgeon of the King George Military Hospital and joint lecturer in surgery at the London School of Medicine for Women He was also Erasmus Wilson Lecturer of the Royal College of Surgeons Among his publications were *The Diseases of the Breast A Handbook of the Diseases of the Skin* and *Medical Science of To day* He also contributed to medical journals papers on dermatology and surgery and translated the Handbuch der Prophylaxe Mr Evans married Ann Frances daughter of the Rev George Piercy, formerly of Canton China He is survived by his widow and three sons and two daughters

The large number of medical men both at home and abroad who in recent years have worked in St Mary Islington Hospital will learn with regret of the death of Dr JAMES POTTER deputy medical superintendent He died after a long illness on August 16 James Potter was born in London in 1889 He qualified M R C S L R C P at the London Hospital in 1911 During the war years he served as a captain in the R A M C in India Mesopotamia, and France and was awarded the M C After the war he acted as house surgeon and later as casualty officer at Queen Mary's Hospital Stratford before joining the staff of St Mary Islington Hospital As a surgeon he was an excellent clinician and most capable operator He will be best remembered however for many fine qualities of character—patience kindness and loyalty Few men can have had so many friends His genial forthright manner and charitable judgment of men made him an excellent companion even to the end Potter maintained a lifelong interest in athletics He had played Rugby for the London Hospital and for the Rhine Army and was a former captain and past president of Ilford Wanderers Perhaps more than any other attribute he possessed the quality of unfaltering courage—courage which did not desert him in the sad days of realized doom At the end Potter counted himself fortunate to be back in the hospital where he had spent so many years of his life and which he loved so much

We announce with regret the death on September 1 of Dr CHARLES HENRY BUBB We are indebted to Mr Percival P Cole for the following notes I first met Bubb in 1897 when we were both entered at Guy's as dental and medical students and my association with him as friend colleague, and patient has lasted ever since The dental and medical courses were undertaken concurrently at that time in Guy's The L D S Bubb obtained in the minimum two years although during this same period he had taken successfully the first and second Conjoint Board examinations Bubb thereafter attended the lectures and filled the clerkships and dresserships necessary for signing up but circumstances ordained that the acquirement of a medical qualification would have to be postponed or abandoned It was not for many years—until 1919 in fact while immersed in the cares and responsibilities of a growing practice—that he found opportunity to complete the final stages of the M R C S L R C P That he did finally take the diploma was characteristic of the tenacity of the man, he might be baulked but he was not beaten Even in these early days there was developed in him a reluctance to take anything for granted a habit of mind that rejected the broad outline or the roughed in sketch and demanded the complete picture as the essential basis for judgment and decision He was a man to whom conviction came only after a thorough and thoughtful assessment of all known facts Achieved thus with difficulty his own views were strongly held and he was perhaps somewhat intolerant, without noise or heat of the views of the other fellow though never of the other fellow himself He spoke no ill of anyone, and only once have I heard him express his dislike for a person His professional knowledge and ability were of a high order As an operator he exhibited great manipulative skill with a gentle consideration that was never a cloak for shirking and that evoked from his patients a surprising vein of fortitude—it Bubb hurt you then you felt sure that it was unavoidable During the war his outstanding qualities of perseverance patience and ingenuity found a wider and more varied scope than was possible in the somewhat cramped and restricted field of routine dental practice He was instrumental in the evolution at the King George Hospital of a maxillo facial department which starting as a pioneer enterprise with one patient expanded till it became a unit of a hundred beds To this end Bubb provided his own equipment and to a great extent employed and paid his own technicians The larger issues involved did not deteriorate one jot or tittle an unrelaxed insistence on accuracy and perfection in every detail which might at times and by captious critics be regarded as fastidious and almost pedantic It was to some a disappointment that he decided to devote his time exclusively to his dental practice after the King George Hospital was disbanded For services thus rendered to the King George Hospital and to the advancement of knowledge and procedure in the treatment of injuries to the face and jaws the O B E was conferred upon him a grade of honour that certainly did not overrate the value of his work Trouble and time meant nothing to Bubb His life was devoted to an unostentatious ideal of service, and his memory to all who knew him will be of a life well lived and a work well done

We regret to announce the death on September 4 of Dr HORACE MARSHALL ABEL Dr Abel received his medical education at Oxford University and St Thomas's Hospital, and qualified M R C S L R C P in 1893 Dr Alfred C Jordan writes The death at the age of 75 of Horace M Abel brings to an end a medical career in the City of London of nearly fifty years duration and for me a cordial and intimate friendship of more than forty years standing It began with our mutual devotion to chamber music He was one of the founders of the Oxford and Cambridge Musical Club and he held the post of honorary secretary throughout this period of forty years My own decision to practise in the City (later exchanged for a radiological career) was due to the fact that Abel was there His start in the City was unfortunate an Oxford friend held the post of secretary to an insurance company He told Abel that the company was about to open a life branch and that Abel should have the post of chief medical officer On the strength of this Abel rented a consulting room in the City But the life department did not come into being and he was stranded with little capital and no patients He bravely stuck to his guns however and slowly work began to come His practice grew in a steady crescendo to the end His downright yet unassuming character gained him the confidence of the heads of the City banks insurance houses mining companies etc with whom his work brought him into constant intimate contact I was associated with him in the City Medical Book Club and the Hunterian Society When the Hunterian Society was threatened with extinction Abel was one of the most active of the council in rescuing it and starting it on a new and vigorous lease of useful life yet his modest nature prompted him to decline the presidency offered him many times He was an active member of the Assurance Medical Society Apart from medicine and music Abel and I had other common interests including lawn tennis and figure skating we frequently forgathered on the ice at Ruislip Elstree and Wimbledon Park and on the ice rinks at Prince's or Hengler's and more recently Golders Green and Millbank He was a loyal friend and a man whose word was his bond—one who throughout life played the game Our deep sympathy goes out to his widow his devoted companion through twenty five years The members of the musical club which owes its existence largely to his initiative learned of his death with dismay and assembled in large numbers to do him reverence

INFECTIOUS DISEASES AND VITAL STATISTICS

We print below a summary of Infectious Diseases and Vital Statistics in the British Isles during the week ended September 3, 1938

Figures of Principal Notifiable Diseases for the week and those for the corresponding week last year, for (a) England and Wales (London included) (b) London (administrative county) (c) Scotland (d) Eire (e) Northern Ireland Median values for the last 9 years for (a) and (b)

Figures of Births and Deaths, and of Deaths recorded under each infectious disease, are for (a) The 126 great towns (124 in 1937) in England and Wales (including London) (b) London (administrative county) (c) The 16 principal towns in Scotland (d) The 13 principal towns in Eire (e) The 10 principal towns in Northern Ireland

A dash — denotes no cases, a blank space denotes disease not notifiable or no return available

Disease	1938					1937 (Corresponding Week)					1929-37 (Median Value Corresponding Weeks)

EPIDEMIOLOGICAL NOTES*

Acute Poliomyelitis

In England and Wales 73 cases of acute poliomyelitis were notified during the week under review compared with 71 in the previous week while in London the number fell from 9 to 5 Notifications of two or more cases were received from Braintree and Bocking 2 Braintree (rural) 2 Finchley 2 Gloucester 2 Lichfield 2 Llanelly 2 Oxford 3 Swansea 7 Wokingham 2 Braintree and district and Swansea remain the two areas in which the disease continues since July 1 when it first appeared in Swansea there have been 32 cases with 5 deaths In none of the London boroughs was more than one case notified the boroughs affected were Battersea Greenwich Hampstead Poplar Stoke Newington The head masters of the schools under the control of the London County Council were notified in the *LCC Gazette* of September 6 that contacts of cases of acute poliomyelitis must be excluded from school for a period of twenty one days from the date of their last known exposure to the disease This instruction amends until further notice the rule hitherto in force that such contacts might continue to attend school unless instructions to the contrary were received from the school medical officer or the borough medical officer of health

The position as regards acute poliomyelitis in Europe is shown in the Weekly Epidemiological Record of the Health Section of the Secretariat of the League of Nations During the four week period ended August 13 and the two week period ended August 27 the number of cases of acute poliomyelitis and acute polio encephalitis in England and Wales exceeded the median value for the corresponding periods of 1927-37 A similar excess was noted in Holland in which notifications during the week ended August 27 rose to 54 (26) 30 of which occurred in the province of South Holland among these 30 cases 7 were at The Hague and 4 each at Boskoop Rotterdam and Waddinxveen In Germany 438 cases of acute poliomyelitis were notified during the week ended August 20 compared with 367 cases in the corresponding week in 1937 the principal areas affected were district of Cologne 36 Wiesbaden 13 district of Potsdam 10 Wurtemberg 26 Bavaria 19 Saxony 13

Typhoid Fever

Typhoid fever was less prevalent in England and Wales during the week under review than in the previous week and much less than in the corresponding week last year Thirty two cases were notified in England and Wales and in only 3 centres was more than 1 case reported—namely Barking 3 Doncaster 3 London 3 (1 each in Shoreditch Stepney and Wandsworth) In the following week 2 further cases were notified at Farnworth—one in the father of two girls who fell ill a month previously and one in a two year old child with no known contact—bringing the total number up to 46 of which 7 patients have died

Diphtheria and Scarlet Fever

Notifications of diphtheria in England and Wales rose considerably during the week under review—1 130 compared with 963—and in London—127 compared with 112 in the previous week The chief centres in which increases were noted are Reading 5 (1) Chester 10 (1) Chesterfield 6 (2) Sedgefield (Durham) 4 (0) Liverpool 52 (45) Manchester 25 (14) Southport 5 (1) Crosby 7 (1) Golborne (Lancs) 7 (1) Camberwell 8 (5) Hackney 8 (3) Hampstead 3 (0) Islington 14 (7) Southwark 11 (5) Wandsworth 9 (5) Brentford and Chiswick 12 (3) Hendon 7 (1), Willesden 8 (0) Newcastle upon Tyne 9 (2) Birmingham 30 (20) Barnsley 14 (3) Sheffield 14 (10) Deaths in the 126 Great Towns of England and Wales fell from 21 to 19 in the week under review but in London they rose from 6 to 7

There was also a rise in the notifications of scarlet fever in England and Wales during the week the figures being 1 391 compared with 1,224 and in London 97 compared with 90 The chief increases were noted in Carlisle 10 (5) Derby 13 (9) Sunderland 13 (5) Bristol 21 (17) Manchester 40 (32) Leicester 9 (5) Camberwell 7 (5) Greenwich 6 (1) Kensington 5 (2) Southwark 10 (6) Wandsworth 10 (5) Woolwich 8 (2) Hendon 7 (2) Birmingham 32 (28) Sheffield 25 (16) One death (in Blackpool) was reported during the week

Measles and Whooping-cough

There were 4 deaths from measles in the 126 Great Towns of England and Wales during the week—1 each in London Kingston upon Hull Sunderland and Warrington The average daily admissions to the LCC fever hospitals were 3 (3) In the metropolitan boroughs in which measles is notifiable the numbers rose in two—Shoreditch 2 (0) Southwark 1 (0)—and were *nil* in Battersea Birmingham Fulham Greenwich, and Hampstead In Scotland notifications fell appreciably during the week—21 compared with 38 in the previous week In the 126 Great Towns of England and Wales 6 (9) deaths from whooping cough were reported 2 (2) in Liverpool and 1 each in London (1) Kingston upon Hull (0) South Shields (0) and Stretford (0) In Scotland 171 (72) cases of whooping cough were notified of which 141 (58) occurred in Glasgow and 15 (3) in Paisley with 4 (3) deaths—2 (3) in Glasgow 1 (0) in Motherwell and Wishaw and 1 (0) in Coatbridge

Cholera

During the week ended September 3 the number of cases of cholera in Shanghai fell from 586 to 421 (10 deaths) and in Hong Kong from 21 to 19 (6 deaths) In British India 8 884 cases and 3 366 deaths were notified in the Central Provinces where the epidemic does not yet seem to have reached its peak On the other hand the incidence of cholera declined in most of the other provinces in India for the week the numbers were Bombay (Presidency) 394 cases with 174 deaths Madras (Presidency) 216 cases with 99 deaths United Provinces 324 cases with 136 deaths North West Frontier Province 27 cases with 25 deaths

* Except where otherwise mentioned figures in parentheses refer to the week preceding the one under review

Medical News

The annual dinner of the Middlesex Hospital Medical School will take place at the Savoy Hotel on Friday September 30 at 7 30 p m

The annual dinner of St Mary's Hospital Medical School will be held at Claridge's on Saturday October 1 at 7 30 p m when Dr Walter Broadbent will be in the chair The special postgraduate course open to all medical practitioners without fee will take place on Thursday Friday Saturday and Sunday September 29 and 30 and October 1 and 2

The annual dinner of the Westminster Hospital Medical School will be held at the Royal Palace Hotel Kensington W on Saturday October 1 with the dean Dr Adolphe Abrahams in the chair The inaugural address of the Medical School will be given by Dr Robert Hutchison President of the Royal College of Physicians of London in the large lecture theatre of the school on Monday October 3 at 3 p m

The annual dinner of past and present students of Charing Cross Hospital Medical School will be held at the Trocadero on Saturday October 1 at 7 30 for 8 p m

QUERIES AND ANSWERS

Income Tax

Deductible Expenses

"T S inquires as to the admissibility of certain expenses

** (*a*) The expense of entertaining clients for the purpose of introducing them to a new partner seems to us to arise out of the change in proprietorship and the inspector's objection would probably be sustained

(*b*) The expenses borne by the firm in connexion with specialists' visits is admissible as being properly incurred in carrying on the practice

(*c*) The uniform allowance for a ship's surgeon is, we believe, correctly stated by the inspector at £20 per annum, but where the period of service in the capacity is so short the basis of taking, say, one twelfth of £20 for a month's work seems clearly unfair We suggest that the inspector might reasonably be pressed to allow a deduction of, say, £5 instead of the £2 offered

Motor Car Expenses

"A C" is a school medical officer and is allowed 3d per mile for the use of his car He proposes to buy a new car and inquires whether he can make any claim to deduct the whole or part of the cost

** A C" is entitled to claim expenses incurred wholly, exclusively, and necessarily in the performance of his duties In our experience Commissioners would not have regard so much to isolated items of expenditure as to the general average over a fairly long period If, taking one year with another, 3d a mile covers the *necessary* expenditure including depreciation—and presumably the school authorities so regard it—then 'A C' would be unsuccessful in his claim and we think he would find it difficult to discharge the onus of proof

LETTERS, NOTES, ETC

Endometrioma of the Appendix

Mr Derrick J Martin (Hastings) writes 'There appeared in the *Journal* of November 20, 1937 (p 1040), an account by Dr J W Bride of an endometrioma of the pelvic colon In this connexion the following case may be of interest A woman, aged 26, for three years had pain in her right iliac fossa often associated with her periods, but occurring at other times as well The attacks were sometimes accompanied by nausea, but there was no vomiting and no pyrexia The pain was relieved by going to bed and applying a hot water bottle to the abdomen but some soreness was always present On examination, a point of strictly localized tenderness was apparent at McBurney's point A radiograph showed defective filling of a mobile appendix, which was tender on palpation A diagnosis of chronic appendicitis was made At operation it was found that the appendix was *not inflamed* but that there was a hard nodule at the base of the appendix and extending into the caecum The appendix and part of the caecum were removed The pathological report (from Dr P Lazarus Barlow) was The wall of the appendix and caecum is thickened and contains small nodules which histologically show endometrium, the glands are regular and lined by a single layer of columnar epithelium Apart from the nodules are scattered glands either singly or in small numbers these occur throughout the muscular wall The condition is that of an endometrioma of the appendix

Abortion and the Law

Dr B DUNLOP (London S W 15) writes Knowing from previous letters of his that Dr A J Brock is deeply concerned about the existence of huge towns and the menacing unrest in Europe, I am surprised that he depricates any extension of the facilities for family limitation His view (*Journal* August 27, p 480) that the abolition of unwanted births will mean the disintegration of society is a most pessimistic one I beg that he will consider the dictum of Professor Carr Saunders that voluntary parenthood must be the basis of any satisfactory population policy

Sentence Postponed for Operation

A reader in Durban sends the following item published by the *Natal Daily News* from its correspondent in Capetown

Accused of criminal injuria, Percival James McHardy a 26-years old European labourer, volunteered to the Magistrate at Caledon Square to undergo an operation for emasculation The charge arose out of an incident in a train between Somerset West and Capetown Medical evidence was that McHardy had perverted instincts His attorney told the Court that arrangements had been made for McHardy to go to Groote Schuur Hospital for an operation McHardy admitted a number of previous convictions and sentence was postponed until completion of the operation

Messrs W. B Saunders Company, Ltd 7 Grape Street W C 2 have published their mid year catalogue of books for medical, nursing, dental and allied professions

KEY TO CURRENT MEDICAL LITERATURE

GENERAL JOURNALS

Deutsche Medizinische Wochenschrift

Berlin vol 64 July 1 1938

Intravaginal Rotation Treatment of Cancer of Cervix—H Martius
Importance of Selective Heating of Certain Layers of Tissues in Ultra-short Wave Concentrator Field—H Schaefer
Retrogression and Disappearance of Malignant Tumours of Rat by Means of Hydrocyanic Strained Muscle—V H Rotlo
Early Diagnosis of Cancer of Stomach Results of Chemical Examinations of Gastric Juice with Various Test Meals and Drinks—A Nosin
Treatment of Tumours of Bladder—W Heckenbach
Technique of Gastroscopy—M Gutzow and T Mandels
Cancer Skin Sensitization Test in Diagnosis of Malignant Tumours—B. Seferyn and N Gr
Development of Cancer Mortality in Ten Large German Towns—H Haubold

Regression of Tumours—This study comes from the University Institute for Cancer Research at Buenos Aires which is under the direction of Professor Roffo He disclaims any pretensions to the discovery of a method for curing malignant growths but suggests that his observations may prove well worth further investigation

Journal of the American Medical Association

Chicago vol 111 July 9 1938

Care and Treatment of Cerebral Lesions—W Phelps
Poliomyelitis Virus in Human Stool—J Frank A Vignec and J Paul
Cutaneous Absorption of Sex Hormones—C Moore J Lamar and N B K.
Follow-up Studies of the 1933 St Louis Epidemic of Encephalitis—J Bredeck G Brown T Hempelmann J M Faulden and H Spector

Boston vol 218 June 30 1938

Relation of Physician to Industry—Emma S Tousant
Three Types of Meckel's Diverticulum—Thomas F Corriden
*Sulphanilamide in Treatment of Gonorrhoea in Females—Burton C Crodberg and Edmund L Carey

Sulphanilamide—The authors treated thirty-two cases of gonorrhoea in women with sulphanilamide by mouth in doses of from 20 to 30 grains daily for a period of about six weeks They report 85 per cent of cures The criteria of cure were (1) at least three negative smears from both cervix and urethra at weekly intervals and (2) absence of symptoms and physical signs

Nordisk Medicinsk Tidskrift

Stockholm vol 16 July 2 1938

Certain Aspects of Aspiration Treatment for Diseases of Accessory Sinuses—I Skoog
Aspiration in Maxillary Sinusitis—H C Andersen
Recently Discovered Secale Alkaloid and their Employment in Obstetrics—H L Kottmeier

Norsk Magasin for Laegevidenskapen

Oslo vol 99 July 1938

*Tuberculous Primary Infection in Puberty and Adult Life—O Scheel
Azotaemia in Haematemesis and Melaena—M S Kobro
Follow up investigations of 466 Patients operated on for Inguinal and Femoral Hernia—W Mathisen

Tuberculous Primary Infection—This clinical radiological and statistical study of tuberculous primary infections in puberty and early adult life emphasizes the importance of tuberculosis contracted for the first time at these ages, and stultifies the von Behring teaching that the primary tuberculosis of adult life is invariably a sequel to an infection in early childhood

Presse Medicale

Paris vol 46 June 29 1938

Numerical Difference between Tuberculosis as an Infection and as a Disease—E Bernard and M Moine
*Diagnosis of Psychical Disturbances in Exophthalmic Goitre—H Welti H Bitruk and Y Mathey
*Pharmacological Study of Medicinal Properties of *Orthosiphon stamineus* Benth—Schuneck de Goldfiem

Psychical Disturbances and Goitre—The authors point out the importance of correctly differentiating mental symptoms due to Graves's disease and those due to other causes before resorting to operation

Orthosiphon stamineus—De Goldfiem describes the remarkable virtues of this herb as a diuretic It has been used for many centuries in Java to provoke diuresis

Paris vol 46 July 2 1938

Diphtheria Anatoxin Vaccination and Diphtheria Prophylaxis—G Ramon
*Note Theory of Cause of Death from Burns—L Christophe

Diphtheria Prophylaxis—Ramon reviews the progress of diphtheria immunization throughout the world and stresses the advantages of giving a mixed diphtheria and tetanus anatoxin

Cause of Death in Burns—Christophe describes a number of experiments on dogs which, he claims, afford definite proof that death from burns is due to a toxin generated in the burnt area and circulating in the blood, which damages certain centres in the brain

Schweizerische Medizinische Wochenschrift

Basle vol 68 July 2 1938

Last Year's Epidemic of Poliomyelitis in Basle—E. Wieland.
Rheumatism and the Sympathetic II—H Iselin
Hitherto Unknown Hereditary Eye Disease (Degeneratio Hyaloideo-retinalis Hereditaria) Noted in Canton of Zurich—H Wagner
Influence of Hypnosis on Pulse—B Stokvis
* Dumb Early Period in Syphilis—K Wolpert

"*Dumb Early Period in Syphilis*—After a discussion of "syphilis without chancre" and lues ignorata," 2400 cases at all stages are analysed It is concluded that in cases in which the symptoms of the early stages are slight there is a predisposition not only to neuroluetic late manifestations but also to tertiary affections of the skin and viscera

Science

Infection of Chorio-allantois of Chick Embryo as Diagnostic Test for Variola—G J Buddingh
Quantitative Studies on Glucose Consumption by *Trichomonas foetus*—J Andrews and J von Brand

Properties and Types of C diphtheriae—The hydrolytic and other properties of this organism were extensively studied in the hope of finding some means of readily distinguishing the different strains No well differentiated biochemical groups were revealed A large number of cultures were typed and their characters classified Of 133 indeterminate types 102 possessed only one or two characters of the gravis type Of the whole 85 per cent had no more than two of these characters The author concludes that there is a trend away from the gravis type

Use of Chick Embryos for Inoculation—The author reviews the employment of chick embryos for inoculation experiments and claims outstanding advantages for this technique Chief of these are it is not too delicate or too uncertain a medium it is bacterially sterile with no latent infection is very resistant to accidental infection, is devoid of complement and specific antibodies (unless the hen has been immunized) and the immunity of the hatched chick to certain infections does not apply to the embryo A possible disadvantage is the occasional difference in susceptibility to certain infections at different stages of growth

Diagnostic Test for Variola—Chorio allantoic inoculation of chick embryo with suspected variolous material offers a better means of distinguishing variola and varicella than corneal inoculation of the rabbit

American Journal of the Medical Sciences

Philadelphia vol 195 June 1938

Studies of Blood Proteins in Dementia Praecox—J M Thomas E V Semrad and R M Schwab

Gastrectomy in Young Swine—In six young swine 6 weeks old at operation the entire stomach was removed and oesophago jejunostomy was performed Control animals were kept under the same conditions (diet etc) The operation gave rise to clinical and pathological changes similar to those of human pellagra Conspicuous features were arrest of growth hypochromic microcytic anaemia and extensive alterations in the skin and in the central nervous system Other changes were inconsistent The findings suggest a specific factor in the stomach of swine as in dog and man which is required to maintain the skin and the central nervous system in a normal healthy state

Transient Nodal Rhythm after Sulphanilamide—A doctor who had taken 8 grains of prontylin (*p* aminobenzenesulphonamide) in one dose developed arrhythmia four days later The electrocardiogram revealed signs of myocardial degeneration and nodal rhythm Caution in the administration of sulphanilamide in cases of cardiac disease is indicated

Dietary v Insulin Treatment—The great majority of obese diabetic patients particularly those 50 per cent or more over weight do not need insulin When such a patient is put on a low calorie diet and his weight is reduced the blood sugar falls to normal without the drug

*Survival of *E typhi* in Sewage Treatment Plant Processes—C E Green and P J Beard

Housing Problems—Poverty is put forward as the underlying cause of slums Relief and housing must proceed together Building houses for the better paid workers does not relieve the situation the poorest families must necessarily live in the poorest houses Housing programmes should concentrate on the lowest 10 per cent Slum dwellers cannot be 'educated' to live healthily in slums

E typhi in Sewage—There is a rapid decrease in the numerical content of this organism during the first three or four days, after which survivors may persist for weeks Survival is longer at lower temperatures Reduction up to 90 and even 99 per cent was noted after activated sludge and also trickling filter treatment These two commonly used sewage treatments are a good but not complete protection A modified Wilson Blair bismuth sulphite medium was used for the quantitative studies

Post-operative Pulmonary Atelectasis Report of Case treated by Artificial Pneumothorax—J A Schindler and W B Gnagi jun

Infarction of Heart—The clinical symptoms in an acute attack of infarction of the heart are analysed in 300 cases Correct diagnosis was uncommon in the absence of pain and mistakes in diagnosis resulted from misinterpretation of the pain In one fifth of the cases a definite prodromal period with slight pain occurred The relative frequency of the different symptoms and signs are well shown in the large amount of material discussed

Subacute Bacterial Endocarditis following Removal of Teeth or Tonsils—The association of septic foci in the teeth and upper respiratory passages with subacute bacterial endocarditis is supported Five cases are reported in which the onset of the endocarditis appeared to follow the extraction of septic teeth or infected tonsils presumably because of the operative trauma causing a transient bacteriaemia It is advocated that to avoid such a catastrophe septic foci should only be removed when the patient is in the best possible condition of health

Value of Experimental Infection of Guinea pigs for Diagnosis of Contagious Anaemia in Horse—H Wittfogel

Arsenic in Human Hair—In forensic medicine the presence or the amount of arsenic in hair (and nails) is often of supreme importance The author raises the question of its normal presence to a recognizable extent and reviews the rather scanty literature In thirty specimens from (*a*) known persons presumably arsenic free (*b*) unknown individuals of both sexes and (*c*) mixed hair cuttings from the hairdressers arsenic was found in every case sometimes under 5 mg but usually about 30 mg per 100 grammes of hair In four specimens from persons known to be suffering from chronic arsenical poisoning the content was about 500 mg per 100 grammes of hair He concludes that the margin is wide enough to prevent mistake in cases of arsenical poisoning

Prevention of Yellow Gall—Yellow gall is a streptococcal infection of the teats and udders of milch cows causing a yellow deposit in their milk It appears to be widespread in Germany An antiseptic water soluble lubricant prepared by a chemist (Dr Weidner) was used instead of vaseline and other fats as a teat lubricant in milking in the hope of preventing spread in the herd The results were not very successful

Diphtheria Control in Germany—The author describes the procedure laid down for early diagnosis and bacteriological recognition of diphtheria as observed in that country Stress is laid upon the search for mild missed and chronic carrier cases and the importance of swabbing the nasal passages as well as the throat but nothing is mentioned about similar examination of the other orifices of the body that may also be infected nor of the impetigo like sores that may occur on the face hands etc of diphtheria carriers The rules for isolation hospitalization and exclusion from school are detailed and the importance of immunization of children in homes and similar institutions is emphasized

Does Empyema of Maxillary Sinus of Dental Origin Exist?—C H Fischer
Treatment of Non healing Sinuses of Mastoid Antrum—H Kramm
Adenoid Vegetations in Elderly Persons—T v Bajkay

Pyramidal Air Cells—Air cells in the petrous pyramid are not the rule in temporal bones and must be looked upon as due to an excessive activity of the mucous membrane of the tympanic cavity A hereditary factor plays a part as does the presence or absence of marrow spaces in the bone Pneumatization of the pyramid continues all through life and the most wide distribution of air cells is often found in old people

Granulation Tumour—A double mastoid operation in a child aged 3 was followed by tumour formation consisting of unhealthy granulation tissue The tumour constantly recurred after scraping and the child died nine months after the first operation with a soft swelling behind the ear the size of a fist The pathology of this exceedingly rare complication is discussed in its relation to sarcoma tuberculosis and epulis and also in relation to general disturbances of the healing processes in diseases of metabolism—for example diabetes

Swiss Penal Code (December 21 1937) compared with Penal Reform in Germany from Psychiatric Standpoint—E Schultze

Liver Damage and Malaria—Of 281 patients therapeutically infected with malaria thirty eight died In thirty one necropsies liver damage was observed which in at least seven cases represented the cause of death The histological findings differed somewhat in early and late deaths The injection of glucose was of value in reducing the number of fatal cases

Cerebral Damage and Short wave Treatment—Schiersmann maintains that possibilities of damage by this method of treatment are not to be taken very seriously If the temperature sense is intact the patient is himself capable of appreciating and reporting an undesirable rise of temperature which is felt to be painful

Study of Total Thyroidectomy for Heart Failure—R Froment and M Jeune
Radiological Aspects of Azygos Vein in Course of Heart Failure—H Durieu and J Lequime

Phrenogastric Syndrome—Five cases are reported showing considerable elevation of the left diaphragm usually with excess gas in the stomach These appearances and symptoms of gastric disturbance might lead one to suspect a primary lesion of the digestive tract but in all cases the electrocardiogram strongly suggested an old myocardial infarction and a clear history of this was present in some of them The hypothesis is advanced that the phrenogastric syndrome is a reflex effect of the cardiac lesion, and that the phrenic nerve may be irritated by chronic pericardial and pleural lesions

Pathogenesis of Encephalitis occurring with Vaccination Variola and Measles—K H Finley
Role of Vitamin C in Metabolism of Nerve Tissue—H Wortis and F J Marsh

Sensory Discrimination after Lesions of Parietal Lobe—In monkeys and chimpanzees trained to discriminate between weights of different magnitude, between patches of emery paper of different roughness, and between various solids lesions of parietal and precentral cortex were produced and the effects on these sensations studied Parallel clinical studies of cortical sensory localization were made In monkeys the lesions were without effect on weight discriminating ability in the chimpanzee the disturbances that occurred disappeared with retraining while in man a small but definite permanent sensory defect was produced It is also concluded that these functions are widely represented throughout the parietal lobe

The Ayala Index—The Ayala index indicates the difference between the initial and the final pressure after removal of a quantity of cerebrospinal fluid It is expressed as final pressure over initial pressure multiplied by the number of cubic centimetres of fluid removed Taking this figure as 10 the authors studied the index in 186 cases of increased intracranial pressure The index was found to be low (below 3 5) in cases of expanding lesions and high in otitic hydrocephalus and arterial hypertension The authors consider the index a useful point in differential diagnosis between otitic hydrocephalus and cerebral abscess They recommend its wider use

New Anti convulsant Drugs—Having first determined the strength of electrical current necessary to produce convulsions in cats by a special method of brain stimulation Merritt and Putnam then tested the effects of different drugs on this threshold Of the standard drugs phenobarbital was by far the most effective in raising the threshold but they also found five drugs (diphenylhydantoin, acetophenone acetophenone oxime benzophenone and propriophenone) which appeared to have an even greater anti convulsant and a less soporific effect The authors are proceeding to clinical trials of these drugs

Tuberculosis and Civilization II Interpretation of the Aetiological Factors in Epidemiology of Tuberculosis—G Wolff
Anthropometric Studies from McCormick Fund—M C Hardy
Correlation of Bore Volume and Soft Tissue Volume in Human Finger tip—G E Burch and W V Sodeman

Masculinity of Stillbirths and Abortions—The analysis of official statistics from a selected area of the United States confirmed the general rule that the sex of stillbirths is more frequently male than female the sex ratio is 1 330 The identification of sex of miscarriages in the early months is difficult between the fifth and seventh month males predominate less over females than during the later period The pattern of the duration of intra uterine existence is thus shown to be different in the two sexes In a certain number of cases the stillbirth is attributed to a specific cause In the group of cases associated with difficult labour males greatly predominate cases in the category of foetal malformation however were more often females than males

Tuberculosis and Civilization—In tuberculosis besides the factor of infection the course of the disease is determined by the hereditary constitution of the subject and the influences of his social environment After making a comprehensive study of the existing knowledge of the subject the writer draws the conclusion that the transformation of the environment is the primary task in controlling the disease The effects of the world war occupation nutrition and overcrowding can all be shown to be significant In fact the mortality from tuberculosis in civilized countries is a sensitive index of the health of the community

London vol 53 August 1938

Some Factors in Relationship of Upper Respiratory Infection and Bronchiectasis—G E Hodge
Presence of Blood in Air Passages after Tonsillectomy—T Leegaard
Peculiar Case of Melanosarcoma of Pharynx—H Brunner

Blood in Air Passages after Tonsillectomy—The author proves by laryngoscopic and x ray investigations that blood and pharyngeal secretions frequently trickle into the airways during the performance of tonsillectomy When the operation is done under local anaesthesia in the sitting position and the pharyngeal mucous membrane is also anaesthetized blood is found in the airways in 80 per cent of the patients operated upon In order to carry out the x ray investigations 1 or 2 c.cm of iodized oil (Merck) were placed into the tonsil bed after the upper pole had been dissected free The contrast medium was shown to be present as far down as in the bronchioles of the lower lobes of the lungs In spite of this septic lung complications are comparatively rare They are more common when general anaesthesia is used apparently because the expulsive power of the cilia is damaged by the general anaesthetic agent

Light sick Rooms—In spite of the necessity for health reasons of sufficient light and air in living rooms tall dwellings in large towns are built round small courtyards so that the lower stories are light sick The author gives elaborate figures, formulae, and graphs for calculating amount of indoor light, window area angle of sky view, etc and produces site plans showing how by rearrangement of the house blocks the essential amenities may be secured

Paratyphoid B conveyed by Dog—Paratyphoid B is occasionally conveyed by domestic animals rarely if ever by a dog The author describes in detail an outbreak limited to one household in a Norwegian village where suspicion fell upon a dog that had recently been ill The suspicion proved well founded as the specific agglutinin was discovered in the dog's blood

Swarming and its Practical Utility—Swarming or spreading of cultures of certain motile bacteria and notably the proteus group, on the surface of solid media is characteristic The author suggests that by the addition of appropriate anti serum to the media the swarming is inhibited and that this procedure could be used as a simplification of the method of preparing a monophasic antigen from diphasic stock

Comparison of Suspension and Carrier Methods—The apparent efficacy of disinfectants varies with the methods used in testing The authors instituted a series of experiments with a view to showing which of the two methods is the freer from experimental error such as the carrying over of adherent disinfectant to the culture media Centimetre squares of cotton wool batiste soaked in culture were used for carriers of the organisms in the latter method and ordinary tap water as the suspensory medium in the former The results are illustrated by graphs and diagrams On the whole the carrier method was found to be the more satisfactory

A NEW *Three-fold* SAFEGUARD

AGAINST DIETARY DEFICIENCIES

IRON, CALCIUM AND VITAMIN D IN ONE TABLET

Caldeferrum is a new combination of three essential nutritional factors — IRON CALCIUM, VITAMIN D — presented conveniently and economically in chocolate coated tablets

The composition of Caldeferrum is best expressed in terms of the intake assured by a daily dosage of four tablets

Four Caldeferrum Tablets supply

IRON 25 mgms (more than sufficient to satisfy even the increased demand during pregnancy and lactation)

CALCIUM 0·5 gm (almost as much as in an extra pint of milk)

VITAMIN D 2,000 international units (a substantial allowance to assist full utilisation of all available calcium)

It will thus be seen how thoroughly Caldeferrum Tablets can safeguard the expectant or nursing mother for example when given as a protective routine Such a combination also clearly provides scope for clinical elaboration as a nutritional measure of potential importance in many conditions of debility and convalescence when a tonic supplement is valuable

FOUR CALDEFERRUM TABLETS DAILY is a simple routine that can be carried out easily and economically by any class of patient The tablets are reasonable in size and the chocolate coating makes them pleasant to take.

CALDEFERRUM

IRON CALCIUM VITAMIN D

GLAXO LABORATORIES LTD., GREENFORD MIDDLESEX BYRon 3434

Adexolin — standardised concentrates of vitamins A and D

The A and D barrier to Infections

PROPHYLAXIS One to three Adexolin Capsules daily Children 1 capsule or 20 drops of the liquid Infants 2 drops in each bottle feed or 10 drops a day in fruit juice TREATMENT At the outset of an infection 4 5 Capsules (or 80 to 100 drops of the liquid) daily In acute infections up to one capsule (or 20 drops) every waking hour may be given

A sound nutritional barrier to infections may be built up by the administration of Adexolin concentrates of vitamins A and D —1 To fortify the epithelium and help to maintain general resistance, 2 To regulate calcium and phosphorus metabolism Adexolin is also valuable by virtue of its effect on the general well-being In principle it may be said that Adexolin treats the patient while specific remedies treat the disease The concentration of the two vitamins in Adexolin has been specially calculated to make possible the utmost flexibility of dosage

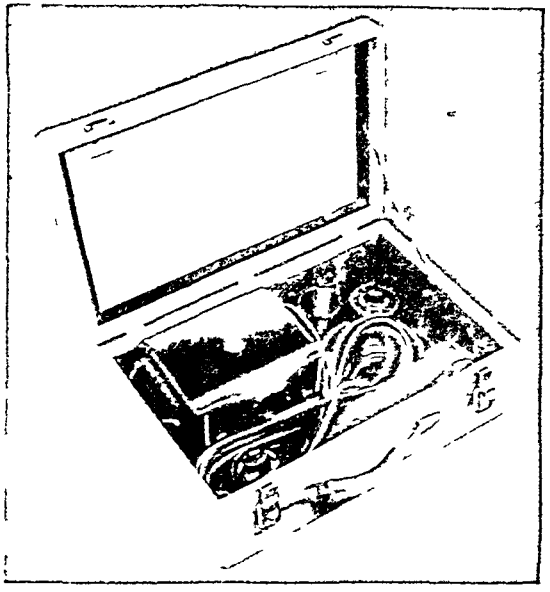
Panties

BY J ROUSSEL

IMPROVE HEALTH & FIGURE



Designed in consultation with the medical profession Panties by J Roussel afford necessary support to the lower abdomen without undue constriction The varied tension of the elastic weave—exclusive to creations by J Roussel—exerts a gentle massaging action which disperses superfluous tissue and stimulates circulation through the abdominal region While the figure thus regains the natural line of youth the system is toned up and the organs encouraged in their natural functioning Doctors may permit patients to wear Roussel Panties in complete confidence that both health and figure will benefit. * Full particulars of other figure-control creations by J Roussel which are equally beneficial to general health are given in our illustrated catalogue We shall be pleased to send you a copy Please ask for booklet K. * A reduction of 2/- in the £ is made on purchases for personal use by members of the Medical Profession

A study of Leprosy from Pre-Christian Times

THROUGH THE LEPER SQUINT
by ANTHONY WEYMOUTH

This book makes fascinating reading not only on account of the way in which leprosy is described but because of the clear manner in which the history of the world is linked up with the spread of the disease A full description of the modern method of fighting leprosy is included 25 Illustration 12 6d net

ADMINISTRATIVE COUNTY OF KENT

PUBLIC HEALTH DEPARTMENT

TUBERCULOSIS OFFICER (Male)

Applications are invited from registered Medical Practitioners for the whole-time appointment of Tuberculosis Officer.

The candidate appointed will be required to work under the direction of the County Medical Officer to devote the whole of his time to the duties of the office, to undertake such other work as may be assigned from time to time, and to reside in such part of the county as may be directed.

Applicants should not exceed 45 years of age and should have had at least three years' post-graduate experience in general medicine and surgery and tuberculosis including Dispensary and Sanatorium duties.

The salary is at the rate of £750 per annum rising, subject to satisfactory service, by three biennial increments of £50 and one of £37 10s. to a maximum of £937 10s., with travelling and subsistence allowances in accordance with the County Council's scale.

The post is designated as an established one under the Local Government and Other Officers' Superannuation Act, 1922, and is terminable by three months' notice on either side. The successful candidate will be required to pass a medical examination.

Applications, stating age, qualifications and clinical experience, with special reference to practical experience in the diagnosis and treatment of tuberculosis, accompanied by copies of *three* recent testimonials, must be received by the County Medical Officer of Health, Sessions House, Maidstone, not later than Tuesday, September 20th, 1938. No personal canvass. Application will be treated in confidence.

SESSIONS HOUSE, MAIDSTONE. W. L. ELVIN, Clerk of the County Council.

September 5th, 1938.

ROYAL NAVAL DENTAL SERVICE

Applications are invited for appointment to commissions as DENTAL OFFICERS in the ROYAL NAVY.

Candidates who must be British subjects below the age of 28 years must hold the degree or diploma of a British University or College of Surgeons and be registered under the Dentists Acts or Medical Acts. Unmarried candidates are preferred. No examination in professional subjects will be held, but candidates will be required to attend at the Admiralty for interview and for physical examination as to their fitness for service in any part of the world.

Successful candidates will be appointed to short service commissions as Surgeon Lieutenants (D) and will receive a grant of £50 towards the cost of providing the necessary uniform on entry. Vacancies in the permanent list will be filled by selection from among officers holding short service commissions who desire to make the Royal Naval Dental Service their permanent career. Officers not transferred to the Permanent List will on the termination of their short service engagement after six years' service be eligible for a gratuity of £1 000.

Opportunities are available for officers on the permanent list for post-graduate study. The assistance of private income is not necessary for the purpose of supplementing official pay and allowances.

Naval Dental Officers are included in the Scheme for Marriage Allowance under the same conditions as for other Naval Officers.

Application Forms and copies of the regulations for entry and conditions of service, rates of pay and allowances, etc., may be obtained from the Medical Director-General of the Navy, Admiralty, S.W.1, and from the Deans of Dental Schools.

COUNTY BOROUGH OF EAST HAM

ASSISTANT MEDICAL OFFICER OF HEALTH (MALE)

Applications are invited for the appointment of an Assistant Medical Officer of Health at a salary of £500 rising by annual increments of £25 to a maximum salary of £600 plus residence, fuel and light (these emoluments being valued for superannuation purposes at £100 per annum) less 5 per cent. deduction for superannuation purposes.

Age not to exceed 45 years.

The successful candidate will be required to work under the direction of the Medical Officer of Health and to undertake primarily duties as resident Medical Officer at the Borough Infectious Diseases Hospital, together with such other duties as may be allocated to him by the Medical Officer of Health from time to time. He will be required to reside at the bungalow at the Hospital.

A Diploma in Public Health is desirable. Experience in the treatment of infectious diseases is essential.

The person appointed must devote the whole of his time to the duties of the Office and not engage in private practice, and will be required to pass a medical examination.

Applications on forms obtainable from the undersigned on receipt of a stamped addressed foolscap envelope must be returned with copies of not more than three recent testimonials, not later than noon on Friday, September 23rd, 1938.

Town Hall, East Ham, E.6. September 19, 1938.

By Order,
E. W. JOSLIN,
Town Clerk.

The nicest way of taking Halibut Liver Oil

HALIBORANGE presents Allenburys tasteless and odourless Halibut-Liver Oil, associated with additional vitamin D and Allenburys Orange Juice

One teaspoonful of Haliborange is equivalent in vitamins A and D to one teaspoonful of cod-liver oil, and in vitamin C to two teaspoonfuls of fresh orange juice

Haliborange is an excellent addition to the diet of babies as a precaution against rickets and scurvy For older children, adolescents, or adults, it is a prophylactic vitamin tonic

Haliborange

Contains the natural vitamins A C and D

In 5, 10 and 40 oz bottles

The Hearing Aid Par Excellence

BŌNOCHORD P. 3

Vest Pocket Valve Amplifier

SMALL AS A MICROTELEPHONE, YET WITH THE HIGHEST OUTPUT EVER OBTAINED FROM A POCKET VALVE DEAF AID

Since their introduction the main obstacle to the general use of valve amplified deaf aids has been their bulk and weight Attempts have been made to produce them in a form suitable for wear on the person without inconvenience, but in every case performance has been sacrificed to size, or the instrument has been ungainly for pocket use

The BŌNOCHORD P3 is a 3 valve amplifier with piezo electric microphone, which will fit *easily* into a waistcoat pocket with separate batteries Special valves designed for us have made this possible, together with the use of small components developed by our Research Department In spite of its small size the aid has the amazingly high maximum output of 60 decibels Let us send you full details of this new instrument, which we believe will do much to establish the general use of valve aids

If the average patient could appreciate the importance of education as well as the doctor does, the problem of constipation would be simplified Lack of intelligence or discipline often makes necessary a treatment that will help the patient to establish a regular bowel movement

Where diet and exercise alone are insufficient, 'Petrolagar' is found to be a mild but thorough adjunct 'Petrolagar' mixes intimately with the bowel contents, to promote soft, easily passed stools

Education is important in the production of 'Petrolagar' too Every step in the manufacturing process is controlled by highly trained chemists whose university education and actual experience qualify them for their responsible positions Accuracy is always the rule by which they maintain the standard quality and efficiency associated with 'Petrolagar'

'Petrolagar' is a palatable emulsion of pure liquid petrolatum (65% by volume) and agar agar, for the treatment of constipation

FORMALGAR

FORMERLY KNOWN AS GARGARISMA FORMALIN CO (HEWLETT'S)

An excellent preparation containing Formalin, Glyc Acid Carbolic, Tinct Pyrethri, etc When diluted in the proportion of one drachm in eight ounces of water, it forms an efficient Gargle for infectious Sore Throat, etc, or an Antiseptic Mouth Wash

MEDICAL OPINIONS

"This is a most economical, efficient, and pleasant Gargle and Mouth Wash It is highly concentrated, one fluid drachm being sufficient for an eight ounce bottle It has been employed by dental surgeons for use after extractions etc, and is also suitable for general purposes' —*Medical Annual*

Dr G H speaks very highly of Gargarisma Formalin Co used twice daily (Gargle—one drachm to eight ounces water) for throat irritation in professional singers

"I have tried your Gargarisma Formalin Co and find the patients like it"—E W S, L D S Eng

Introduced and prepared only by

C. J. HEWLETT & SON, LTD.

35/42, Charlotte Road and 83/85, Curtain Road, LONDON, EC 2

NICOTINIC ACID B.D.H.

Prolonged adherence to a special, restricted diet, such as may be prescribed for a patient with gastric ulcer, in addition to producing premonitory or frank symptoms of scurvy or beriberi, may be responsible for the onset of pellagrous symptoms Recent reports (*Lancet, January* 29, 1938, *p* 252, *ibid p* 253, *April* 23, 1938, *p* 944) indicate that the risk of even frank pellagra appearing in such circumstances is not so remote as might at first appear

The specificity of nicotinic acid in pellagra is established and Nicotinic Acid B D H should be prescribed whenever the condition is encountered

This product, also Ascorbic Acid B D H (Vitamin C) and Vitamin B_1 B D H, should be given prophylactically to all patients who are receiving a restricted diet in order that the manifestation of symptoms of vitamin deficiency may be prevented.

OVALTINE

SEBEK was identified with the Sun God RA

IN NUTRITIONAL CRISES

WHILE the average adult is able to maintain a healthy existence on the ordinary everyday diet there are certain periods in the life of each individual when an increased demand for the vital food elements arises Outstanding examples are the period of adolescence the pregnant and nursing states and the stage of convalescence after severe and lowering illnesses

Ovaltine is an eminently satisfactory adjunct to the ordinary dietary at all such times Composed of fresh full cream milk eggs and malt extract in proportions adjusted to meet physiological requirements it provides in an agreeable form calcium phosphorus vitamins and other important food elements

Ovaltine is a metabolic stimulant and digestive which assists the assimilation of other foods and promotes general good health It can therefore be taken regularly with advantage in place of tea coffee or other beverages A noteworthy feature is its delightful taste which is appreciated by people of all ages

B.D.H. COMMON COLD VACCINES

The common cold is regarded as being due primarily to infection by a virus, with secondary invasion by the organisms usually found in the upper respiratory tract It is believed that these organisms which are normal inhabitants of the naso-pharynx may, under certain conditions, assume a pathological rôle

No vaccine against the infecting virus is at present available, and the value of the Common Cold Vaccines lies in their power to diminish the activity of the secondary invaders Three vaccines against these invaders are prepared in the B D H laboratories

B D H Common Cold Vaccine (Anticatarrhal)
B D H Influenza Vaccine (Mixed)
B D H Influenza Vaccine (British Army Formula)

DOSAGE The vaccines are generally used for prophylaxis, a course of four injections being given 0 25 c c, 0 5 c c, 1 0 c c, 1 0 c c at weekly intervals, they may be given, also, therapeutically—small doses being employed

SERENOL

biological non-toxic

SEDATIVE

Formula

Campho Sulphonate of sparteine	6 0 grains
Campho Sulphonate of ephedrine	2 5
Extract of boldo	10 0
Extract of crataegus	20 0 ,,
Extract of salvia	10 0 ,,
Tincture of marrubium	10 0 ,,
Glycerine extract of thyroid (1 equals 1 of fresh gland)	0 10 ,,
Valerian	50 0 ,,
Hexamethylene tetramine	10 0 ,,
Excipient q s	ad 1 000 c c

PRICE 4/6 per 4 oz bottle

Sample and Literature on request

Serenol is a sedative with action on the centres of the nervous vegetative system, sympathetic and parasympathetic, and on the cortical centres Recent knowledge has shown the interaction of nervous vegetative system and endocrine system, and on this knowledge SERENOL is based It is thus a biological, not a symptomatic, sedative, and, unlike many other sedatives, has not a direct depressant action on the cortical cerebral centres

Serenol is indicated in conditions of anxiety and general irritability, insomnia, hyperthyroidism, hyperadrenalism (as in neurocirculatory asthenia, effort syndrome), the so-called nervous palpitations of the heart, etc

Serenol is given in the following dosage For mild cases one to two dessertspoonsful on retiring For more severe cases one dessertspoonful at 10 a m , one dessertspoonful at 4 p m and two dessertspoonsful on retiring

Serenol, being a biological sedative containing no barbiturate, is not habit forming

MEDICAL FACTS ABOUT TEA

In order to remove certain popular misconceptions about the chemical properties of Tea, thorough clinical and laboratory investigations have been conducted The following is a brief summary of the main results of these investigations —

(*a*) Tea as normally drunk is harmless and has no ill effects whatever on the human body The amount of caffeine and tea tannin in tea is pharmacologically small

(*b*) Tea tannin is a different substance from the tannic acid of the Pharmacopœia, which is a Pyrogallic tannin, and the two should not be confused

(*c*) Clinical experiments have shown that the action of tea tannin is very much milder than that of tannic acid, and the different composition of the two tannins is proved by the fact that the tannic acid of the Pharmacopœia is about 25 times stronger as an acid than tea tannin

(*d*) Many common beverages besides tea contain similar tannins

(*e*) A thorough investigation reported in "The Analyst" (1936, Lxi, 310) could find no tea on the market which was free from tannin If there were any such teas, they would be almost entirely tasteless

INDICATIONS FOR 'SANATOGEN' No 14

CARDIAC INEFFICIENCY

Some Unfounded Beliefs.

Two distinguished cardiologists have recently drawn attention to some common yet unfounded beliefs about cardio-vascular disease It seems to be established that the dyspnoea, dizziness and other symptoms frequently attributed to myocardial degeneration are more often than not due to quite other causes, such as hyperpiesis, obesity, or some "vasomotor disturbance of psychoneurotic origin" We have it on the authority of Lewis that physical strain however severe "never injures the normal heart fibres, never produces injurious dilatation and never exhausts the heart's reserve" Not, apparently, in a healthy, normal individual does the heart become flabby or dilated by reason of age, or even of toxaemia One thing that seems to be certain is that in all cases of suspected cardiac inefficiency the minimum strain should be put on the digestive organs Especially is bulky food to be avoided It is in this part of the treatment that 'SANATOGEN' often proves so helpful

'SANATOGEN' is a carbohydrate-free product of ninety-five per cent pure milk casein with five per cent sodium glycerophosphate It is readily digested and absorbed, leaving no appreciable residue, and it is non-irritating to the intestinal mucous membrane

"I have tried your product 'SANATOGEN and have been quite satisfied with the results This patient was a heart case, and had been unable to retain food in stomach She got into a very low condition which of course reacted on her heart condition I am pleased to say she has now much improved and continues to use SANATOGEN —M B B Ch

'I have used 'SANATOGEN for a woman of 74 frail definitely myocardial and very difficult to feed The result has been most gratifying She has shown steady improvement from the first dose Her digestion and appetite are now as good as they were two years ago and she is able to take milk again which has not been the case for a long time She has only complained of cardiac distress once since taking the SANATOGEN Before this she had it almost daily She lives in my house so I have every opportunity of observing her —L R C P, L R C S

'SANATOGEN'

(Trade Mark)

A brand of Casein and Sodium Glycerophosphate

Sold by all chemists price 2/3 to 19/9

DOSAGE For children and adults two teaspoonsful three times daily or according to circumstances For infants ½ teaspoonful added to each bottle feed

The word SANATOGEN is the Trade Mark of Genatosan Ltd and denotes the Brand of Casein and Sodium Glycerophosphate manufactured by GENATOSAN Ltd exclusively by GENATOSAN Ltd Loughborough Leicestershire

"COMMON COLD"

AND

ANTI-CATARRH VACCINE (EVANS)

(LOCAL STRAINS)

For Prophylaxis and Treatment

The facilities of the pathological laboratories at **EVANS BIOLOGICAL INSTITUTE** enable us to issue vaccines prepared from organisms collected in the locality in which the vaccine is to be used It will be appreciated that such vaccines are highly specific, producing a greater proportion of successful results than is usual with ordinary Stock Vaccines

The following formulæ have been evolved af er many years experience as having a comprehensive selection of organisms as found in numbers of typical cases in the correct proportions

COMMON COLD & ANTI CATARRH VACCINE (EVANS)
(No 3 for Prophylaxis)

M catarrhalis	200 *million*	per cc
Diplococci pneumoniæ	200 ,,	
Streptococci	200 ,,	
B Friedlander	100 ,,	
B septi	100 ,,	
Staphylococci (alb et aur)	200 ,,	
M tetragoni	100 ,,	
B influenzæ	100 ,,	

COMMON COLD & ANTI CATARRH VACCINE (EVANS)
(No 1 for Treatment)

M catarrhalis	50 *million*	per cc
Diplococci pneumoniæ	50 ,,	
Streptococci	50 ,,	
B Friedlander	25 ,,	
B septi	25 ,,	
Staphylococci (alb et aur)	50 ,,	
M tetragoni	25 ,,	
B influenzæ	25 ,,	

DOSAGE—PROPHYLACTIC (Vaccine No 3)

As different patients vary in their reaction to vaccine treatment it is only possible to suggest the average procedure A brochure which deals fully with the question of dosage will be sent on application In general a serie of three injections (given before the season during which the person is usually susceptible) is recommended The initial dose is 0 25 cc followed by 0 5 cc after an interval of seven days and a further 1 cc. after another week o so

DOSAGE—CURATIVE (Vaccine No 1)

In acute conditions an initial do e of 0 1 cc. or 0 2 cc. and in chronic conditions 0 25 cc. The initial do e may be repeated after three days If no reaction is produced subsequent injections can be larger

'COMMON COLD' AND ANTI CATARRH VACCINES (EVANS) (Local Strains) are issued as follows

Boxes of 3×1 cc. Ampoules No 3 Vaccine (Prophylaxis) 7/- per box
Boxes of 6×1 cc Ampoules No 1 Vaccine (Treatment) 14/- per box
Also in 5 cc. 10 cc. and 25 cc. bottles and in single Ampoules

"Vitamin B_1 deficiency an outstanding fault

in the diet of many millions of people"

(B M J, 16 Oct, 1937, p 753)

The reduction in Vitamin B_1 intake, due to changes in dietary habits during the last hundred years, normally amounts to at least 50 per cent, and may be as much as 70 per cent It has been demonstrated, both experimentally and clinically, that a shortage of Vitamin B acts as a limiting factor in the maintenance of health and nutrition, and often results in gastro-intestinal disorders, loss of appetite, indigestion, constipation and, if long continued, to neuritis and arthritis

The logical way to rectify such shortage is to restore to the diet the Vitamin B-containing substance whose removal is responsible for the deficiency

This substance is available in the form of Bemax

For years it has been the policy of the proprietors of Bemax to ensure its Vitamin B_1 activity by biological assay of *every day s output* So far as is known, Bemax is the only food product for which such a claim is or can be made

The quantity of Vitamin B_1 supplied by the normal daily dose of Bemax—one tablespoonful—is 200 International Units, an amount sufficient to raise a deficient diet to an optimal level

The normal daily dose of Bemax supplies, in addition to Vitamin B_1, significant quantities of Vitamin B and B_2, Copper, Iron and Phosphorus as well as rich quantities of Vitamin E and other essential dietary elements

Bemax is an entirely natural product consisting only of stabilised wheat germs selected for their Vitamin B_1 activity with no addition whatsoever Clinical sample and literature on request The Bemax Laboratories, 23, Upper Mall, Hammersmith, W 6

Sterility and Habitual Abortion

The increasing use of Vitamin E for habitual abortion and sterility of dietary origin demands a wheat germ oil of proven high activity and of stable Vitamin value Such an oil is available for the medical profession in Fertilol

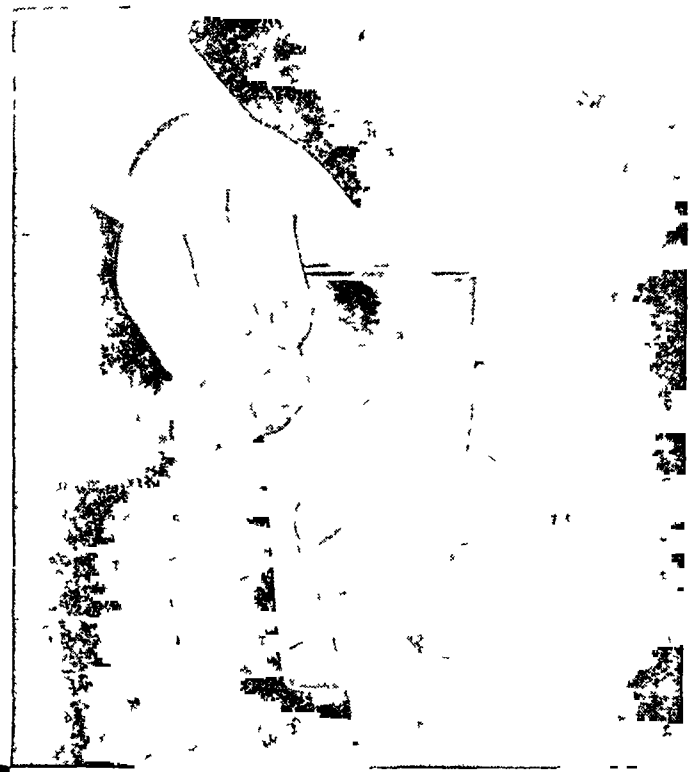
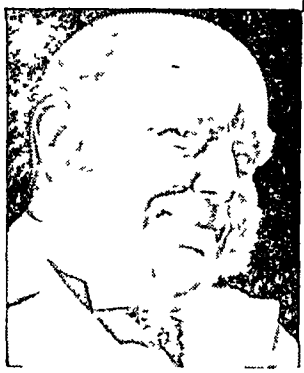
CRUNCHY FOODS

and the digestive juices

The view that the process of digestion begins in the mouth is accepted by most physicians The importance of a free flow of saliva cannot, therefore, be underestimated



Crunchy foods which must be masticated thoroughly before they can be swallowed, naturally increase the flow of saliva It is generally believed that such crunchy foods therefore reach the stomach in an easily assimilated form, and also that softer foods taken at the same time will derive benefit from the extra saliva



For these reasons many doctors recommend patients to include Ryvita in their diet A complimentary carton of Ryvita will gladly be supplied on request

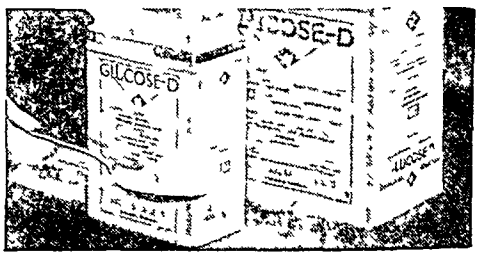
THE SIGN OF A GL PRODUCT



GLUCOSE-D

for the

SUNSHINE-DRESSED CHILD

Supplements
ENERGY

treats
KETOSIS

For many children, the usual increase of activity in summer seems to result in an aftermath of exhaustion and drowsiness Metabolic upsets, especially incomplete oxidation of fats (ketosis), are common Often the child is subject to travel sickness

A regular course of Glucose-D is a simple and rational method of providing the extra, assimilable carbohydrate that will avert these symptoms Glucose-D provides the necessary impetus to fat-oxidation and builds a reserve of glycogen to meet increased expenditure of energy It is a rational method because Glucose-D also provides elements in which the restricted (low fat) diet of the bilious child is likely to be deficient, *i e*, calcium, phosphorus, vitamin D

To sum up, Glucose-D is recommended as a useful dietetic supplement to *keep the well child well* And it is of special value in restoring the nervy, irritable, drowsy child to normal vigour

Finely powdered medicinal glucose with calcium glycerophosphate and Ostelin vitamin D

In 1 lb tins 1/9 three times quantity 4/6 seven times, 10/6 These prices (not applicable in Eire) are subje t to the usual professional discount

LATE RESULTS OF PARTIAL GASTRECTOMY FOR PEPTIC ULCER

BY

JOHN MORLEY, Ch M, F R C S

Professor of Surgery Manchester University Honorary Surgeon Manchester Royal Infirmary

AND

F H BENTLEY, B Sc, M B, F R C S

Chief Assistant Professorial Surgical Unit Manchester Royal Infirmary

(From the Department of Surgery University of Manchester and the Manchester Royal Infirmary)

The operation of partial gastrectomy provides a unique opportunity for considering the relation between gastric function and the general health of the patient as a whole It is generally recognized that disturbance of this relation after partial gastrectomy does sometimes lead to constitutional changes although there is conflict between different authorities as to the incidence of such changes

Ten years ago Morley reviewed the results of his experiences with the Polya and the Billroth I (Schoemaker) forms of gastrectomy, and came to the conclusion that whereas a Polya gastrectomy carried with it a serious liability to anaemia the liability was diminished after a Schoemaker operation which was less destructive of gastric activity It was considered wise to review the results particularly of the Schoemaker operation after a further number of years and the present investigation was undertaken to determine the health of a series of individuals more than four years after partial gastrectomy having special regard to gastric activity and blood changes

Material

Sixty seven patients who had had partial gastrectomy performed by one of us (J M) were examined The interval since operation was from four to sixteen years with an average of eight and a half years These sixty seven patients were not a consecutive series but were those who could be traced and who were willing to come for examination out of 130 cases Fifty eight of the sixty seven patients had undergone Schoemaker gastrectomy and nine Polya gastrectomy for the following conditions (Table I)

TABLE I—*Operation Details*

	Gastric Ulcer	Gastric Ulcer and Duodenal Ulcer	Gastric Ulcer and Healed Duodenal Ulcer	Duodenal Ulcer	Anastomotic Ulcer	Total
Schoemaker	44	6	4	3	1	58
Polya	8	—	—	1	—	9

Methods

Each patient was investigated by general examination blood count and fractional gastric analysis Fractional gastric analysis was carried out as follows the patient fasting from the night before (about twelve hours) swallowed a Ryle's tube Any resting gastric secretion was withdrawn and 10 oz of oatmeal gruel given by mouth At fifteen minute intervals 10 c cm samples were withdrawn At the end of an hour 0·25 mg of histamine was injected subcutaneously and four further samples of gastric contents were withdrawn at fifteen minute intervals The gruel test meal was used because we were anxious to know the response of the stomach to food and to have an indication of the emptying time of the stomach and of regurgitation of intestinal fluids through the stoma Histamine was later injected so that the stomach might have the maximal acid secreting stimulus In each sample the free and total acids were determined using Topfer's reagent and phenolphthalein as indicators the presence of starch was tested for by iodine and the presence or absence of bile judged by the colour of the specimen

A blood count was performed by means of the Thoma-Zeiss haemocytometer and haemoglobin determined colorimetrically after reduction of the blood with carbon monoxide

Results

Gastric function has been assessed from the test meal findings and on this basis the cases can be divided into two broad groups (1) those whose gastric function is depressed and (2) those whose function is active The criteria of the former group are emptying time below one and a half hours (average one hour) free acid values below 20 c cm N/10 acid (the majority in this group have no free acid) bile regurgitation freely occurring The criteria of the group with active gastric function will be readily inferred emptying time above one and a half hours free acid above 20 c cm N/10 acid no bile regurgitation It is significant, and will be referred to later that where bile regurgitation was absent free acid values above 20 c cm N/10 acid were usual

In considering the results of the blood counts we have accepted 85 per cent haemoglobin as being the lowest limit of the normal (Janet Vaughan, 1936), so that we have regarded a haemoglobin percentage of 80 or below as constituting anaemia In all our cases of anaemia the haemoglobin percentage will be found to be quoted

POLYA GASTRECTOMY —*9 cases 4 male 5 female Number of years since operation maximum 16 minimum 6 average 12*

Gastric Function

Depressed in all cases Free bile regurgitation occurred in all No free acid detected in any case Average emptying time three quarters of an hour

Blood Picture

Normal count 3 cases—2 male 1 female
Microcytic anaemia 5 cases—2 male 3 female Haemoglobin percentages 82 (a treated anaemia was previously 40) 80 63 54 38
Macrocytic anaemia 1 case—a female Operation 1925 1928 microcytic anaemia (Hb 48 / colour index 0 48) 1935 macrocytic anaemia (Hb 38 / colour index 1 32)

General Health

Good 6 cases (Criteria of good health no illnesses no complaints working)
Good until pernicious anaemia developed now good again under treatment 1 case
Fair 2 cases Both have microcytic anaemia with complaints of the anaemia

Ulcer Symptoms Since Operation —No case

SCHOLMAKER GASTRECTOMY —*58 cases 43 male 15 female Number of years since operation maximum 14 minimum 4 average 8 In 45 cases gastric function was depressed (Group 1) In 13 cases gastric function was active (Group 2)*

GROUP 1 CASES 45 cases—31 male 14 female

Gastric Function

Depressed in all cases Bile regurgitation present Free acid in 34 cases no free acid detected in 11 cases free acid was between 1 and 20 c cm N/10 acid Average emptying time 1 hour In 27 of these cases gastric function was greatly depressed (comparable with the Polya cases)

Blood Picture

Normal count 33 cases—25 male 8 female
Microcytic anaemia 12 cases—6 male 6 female Haemoglobin percentages 80 80 80 80 80 80 80 78 72 70 60 55

General Health

Good 38 cases
Good for 6 years then developed gastric carcinoma 1 case
Fair 6 cases 4 have microcytic anaemia with complaints of the anaemia

Ulcer Symptoms Since Operation 1 case

GROUP 2 CASES 13 cases—12 male 1 female

Gastric Function

Active No bile regurgitation Free acid above 20 c cm N/10 acid average 52 c cm Stomach not empty in 14 hours

Blood Picture

Normal count 12 cases—11 male 1 female
Microcytic anaemia 1 case—a male Haemoglobin 80 / Patient recently in sanatorium ? phthisis

General Health

Good 10 cases
Good for 7 years then developed gastric carcinoma 1 case
Fair 2 cases (one has thyrotoxicosis)

Ulcer Symptoms Since Operation

1 case has uneasy feeling in epigastrium unless eating often Free acid 80 c cm N/10 acid
2 cases have pain after food Free acid 47 and 58 c cm N/10 acid respectively

Gastric Activity after Partial Gastrectomy (Polya and Schoemaker)

The chief functions of the normal stomach appear to be the early breakdown of food constituents by ferments, the intimate mixing of the food and its slow rhythmic delivery in semi-fluid form to the duodenum, and the solution of mineral constituents of the food by hydrochloric acid but in the present state of our knowledge there is no uniformly satisfactory test for these functions We have therefore used the information of the gruel-histamine test meal to assess gastric activity in the present series The information consists of emptying time, amount of free acid in the stomach contents and an estimation of any regurgitation of intestinal fluids through the stoma as judged by the presence of bile in the samples

Using these criteria, it is seen that gastric activity was depressed in forty-five out of fifty-eight Schoemaker cases, and in all the nine Polya cases There were differing degrees of depression In the Polya cases gastric activity was abolished rather than depressed, for the stomach emptied very rapidly, no free acid was detectable, and bile regurgitation was so free that the samples resembled pure bile A similar drastic reduction was found in twenty-seven of the forty-five Group 1 Schoemaker cases (depressed gastric activity) In the remaining eighteen Group 1 cases gastric activity was less completely abolished, and in thirteen (Group 2) cases gastric activity was normal That is, in the Schoemaker cases gastric activity was greatly depressed (abolished) in nearly a half, depressed in almost one-third, and normal in about a quarter

The three factors available from the gruel histamine test meal are together of much more value in assessing gastric activity than a consideration of the level of acid secretion alone There are, however, one or two points of interest as regards acid secretion in these cases, especially as various opinions are held concerning the capacity of the stomach to secrete free acid after partial gastrectomy Originally it was considered by many that secretion of free acid was almost entirely abolished, but this is clearly not so and series of cases have more recently been published (Klein *et al*, 1933) showing that achlorhydria or relative achlorhydria is achieved only in about 50 per cent of cases of partial gastrectomy Snell (1937) points out the large number of variables which enter into the problem and which make a constant result unlikely

In our series of nine Polya gastrectomies no free acid was demonstrated in any case, and in fifty eight Schoemaker gastrectomies there was no free acid in thirty four cases, relative achlorhydria in eleven, normal acid values in ten, and high values in three That is, about 60 per cent showed achlorhydria and 20 per cent relative achlorhydria The higher incidence of achlorhydria in our series may be accounted for by the large number of gastrectomies done for gastric rather than duodenal ulcers It is recognized that reduction of free acid following gastrectomy for duodenal ulcer is less likely to occur than when gastrectomy is done for gastric ulcer, and in this connexion it is interesting to note that two of our three cases with high acid values were gastrectomies for duodenal ulcer

The mechanism as well as the degree of reduction of free acid after partial gastrectomy is the subject of dispute Certainly not enough of the fundic mucosa is removed to cut off the source of hydrochloric acid, unless it is believed that the capacity of this remaining portion of the stomach to secrete acid is diminished as a result of removal of the pyloric end of the stomach A hormonal connexion between these two parts of the stomach has often been suggested but never conclusively demonstrated, and the experimental results of Priestley and Mann (1932) appear to rule out such connexion Recently, however Hill, O'Brien, and Wilhelmj (1937) have shown in dogs that the reduction in acidity following partial gastrectomy is greater than can be accounted for by dilution and neutralization alone, and, further that when a pouch is made of the fundic part of the stomach and its secretion collected much more acid secretion occurs where the pylorus is intact than where the pylorus has been removed They conclude that there is a pathway between the pyloric and fundic parts of the stomach, possibly hormonal, possibly

nervous The significance of this factor in man cannot yet be assessed for it is to be noted that these results were obtained in short term experiments in dogs, and as Snell has observed the human stomach has a strong tendency to return so far as the surgical procedure allows to its original state of both secretory and motor activity The occurrence of acid values of 80 to 90 c cm N/10 acid (as occurred in three of our cases eight years after partial gastrectomy) does not suggest a lowering of acid secretion in those cases

The factor of simple dilution and neutralization is stressed by Walters (1936) as the factor chiefly responsible for diminished acid values after partial gastrectomy and the significance of this factor is further emphasized in our results It was a notable feature of our case groups that achlorhydria was usually accompanied by free bile regurgitation and that when free acid was demonstrable there was very little or no regurgitation of bile This occurrence of free acid without bile and achlorhydria with bile was so marked that it is not reasonable to consider it to be a coincidence but rather that the presence of bile indicates dilution and neutralization and that free acid is probably secreted in many of the achlorhydric cases only to be rendered incapable of detection by free regurgitation of duodenal contents and by rapid emptying of the stomach This observation is further supported by the nine Polya cases in none of which was free acid detected and in all of which regurgitation of bile was a pronounced feature It should be observed however that it is unlikely that free acid secretion is of significance in such cases because of its prompt dilution and neutralization

Although the Polya series is a small one it would appear that Polya gastrectomy leaves a very rapidly emptying stomach with free regurgitation of intestinal fluids and consequently no detectable free acid and that Schoemaker gastrectomy gives a similar result in some cases but that in many regurgitation is not so free emptying of the stomach is not so rapid and reduction of free acid not so great It does not seem reasonable to conclude that there is much difference between the amount of acid secreted after the two operations or that true achlorhydria is produced in more than a few cases Whether the differences between the two types of gastrectomy are of significance either locally as regards further ulcer formation, or constitutionally, will be discussed below

Blood Picture after Partial Gastrectomy

The occurrence of anaemia after partial gastrectomy has frequently been noted and although expectations of a macrocytic anaemia have only occasionally been realized microcytic anaemias of varying degrees of severity have often been observed Now that it is understood that a macrocytic anaemia follows absence of intrinsic factor (haemopoietin) from the alimentary secretions and that the first part of the duodenum probably shares with the pyloric part of the stomach in the secretion of intrinsic factor development of a macrocytic anaemia after partial gastrectomy is not to be expected to occur frequently Such expectations are borne out in our results In sixty-seven patients there were nineteen with anaemia—eighteen of them microcytic in type and one who was originally microcytic and subsequently became macrocytic

Of the nine patients with Polya gastrectomy six were anaemic with haemoglobin ranging from 80 to 38 per cent all these cases were microcytic in type originally but one subsequently developed true macrocytic (pernicious) anaemia Of fifty eight patients undergoing Schoemaker gastrectomy thirteen were anaemic all microcytic in character with haemoglobin ranging from 80 to 55 per cent

Investigation of the relation between gastric function and anaemia in the fifty eight Schoemaker cases revealed a very interesting condition Thirteen patients had anaemia and twelve of them belonged to the group in which gastric function was depressed (forty-five cases) Only one occurred in the group in which gastric function was active (thirteen cases) and there was reason to doubt the gastric origin of this anaemia because of a history of sanatorium treatment for lung disease (? pulmonary tuberculosis) It was stated above that in the forty five Group 1 cases (gastric function depressed) there were varying degrees of depression and that gastric function was largely abolished in twenty seven of the cases and was less severely depressed in eighteen It is therefore interesting to note that ten of the patients with anaemia belonged to this subgroup of twenty seven cases whose gastric function was largely abolished That is

> Ten patients were anaemic out of twenty seven whose gastric function was largely abolished
>
> Two patients were anaemic out of eighteen whose gastric function was depressed
>
> One patient was anaemic out of thirteen whose gastric function was active (The anaemia was probably not gastric in origin)

This suggests that the cause of the anaemia may be associated with the gastric conditions peculiar to the Group 1 cases The question of the intrinsic factor does not we consider, enter into the problem here for none of the anaemias are macrocytic in type The three significant features of gastric activity of Group 1 cases are rapid emptying free regurgitation of intestinal fluids and absence of free acid in the gastric contents Free regurgitation of intestinal fluids dilutes and neutralizes any acid secreted by the stomach Absence of free acid does not in itself lead to anaemia (Bloomfield and Polland 1933, Wilkinson 1937) but it may predispose to anaemia by interfering with normal solution of iron in the stomach and possibly with its absorption in the upper jejunum (Witts 1936) The role of hydrochloric acid in this connexion has however, not been entirely proved, and the other factor that of rapid emptying of the stomach may be of greater significance by causing incompletely mixed under digested food constituents to be hurried through the duodenum and upper part of the jejunum and so interfering with iron absorption The cause of these microcytic anaemias thus may be diminished iron absorption resulting from severe depression of gastric activity It is well known that considerable improvement is obtained in such post gastrectomy anaemias by the administration of massive doses of iron.

This conclusion which emerges from a study of the Schoemaker gastrectomy results is further supported by those of the Polya operations Depression of gastric function was particularly severe in the nine patients with Polya gastrectomy and among them there were six patients with microcytic anaemia (one subsequently becoming macrocytic) Table II contrasts the test meal findings in the anaemic patients with those in patients showing a normal blood picture

It will be noted that of the sixty seven patients in this investigation forty-seven were males and twenty females Of the nineteen cases of anaemia nine were males and ten females—that is a greater tendency to anaemia is found in females than in males This would be expected from the normal tendency for women to have a lower haemoglobin percentage than men and from their peculiar

liability to achlorhydric anaemia The gastric origin of anaemia in these cases is, however, stressed by the fact that a definite proportion of the cases of anaemia occurred in men = Idiopathic microcytic anaemia in men is described by Witts (1930) as a haematological curiosity

TABLE II

	Microcytic Anaemia (19 cases Hb 80% or less)	With Normal Blood (48 cases Hb more than 80%)
Form of gastrectomy	Polya 6 Schoemaker 13	Polya 3 Schoemaker 45
Sex	Male 9 Female 10	Male 38 Female 10
Emptying time (average)	42 minutes	80 minutes
Bile		
Present + +	18	20
traces	1	16
None	0	12
Acidity		
No free acid	17	27
Below 20 c cm	1	9
Above 20 c cm	1 (sanatorium case)	12

The case of microcytic anaemia subsequently becoming macrocytic is of interest Wilkinson (1933), Janet Vaughan (1932), and Heck and Walters (1936) have described cases showing that an anaemia may change from typical microcytic to macrocytic type within a few weeks, particularly under the influence of iron therapy In the present instance it is known that iron was given for some months before the patient was sent in 1935 for blood examination, and it may be that this is a comparable occurrence We feel, however, that the problem may be a more complicated one and that there is not enough evidence to form a conclusion

If depression of gastric function leads to anaemia it would be expected that the operation that produced more severe depression would have the higher incidence The following figures are therefore of significance The same standard of anaemia is adopted as in this paper

Gordon Taylor 1929
Fifty two Polya gastrectomies two to seven years after operation Anaemia in twenty eight cases

Morley 1928
Twenty Polya gastrectomies average period since operation seven years Anaemia in sixteen cases

Total of Morley's figures (that is 1928 and 1938)
Twenty five Polya gastrectomies average period since operation nine years Anaemia in nineteen cases

It is thus clear that in the hands of one surgeon a gastrectomy that produces severe depression of gastric activity has a much higher incidence of post-operative anaemia (Polya, nineteen out of twenty-five) than a gastrectomy that is less destructive of gastric function (Schoemaker, thirteen out of fifty eight) And it follows that where gastrectomy is performed for gastric ulcer one aim should be to construct the stoma so that the emptying time of the stomach is prolonged and regurgitation of intestinal fluids lessened, if the risk of post-operative anaemia is to be reduced as much as possible It is our opinion that this is more readily to be obtained with the Schoemaker modification of the Billroth I operation than with the Polya gastrectomy These remarks apply to the treatment of gastric ulcer In duodenal ulcer where the risk of recurrence is much greater, the more destructive Polya operation has definite advantages

General Health after Partial Gastrectomy

In our sixty-seven cases the general health was good in fifty five—that is to say, there had been no serious illness, and the patients made no complaints and were able to do full work

In two cases gastric carcinoma developed after six to seven years of perfectly good health following Schoemaker gastrectomy It so happened that each patient was examined within a few weeks of the onset of symptoms of carcinoma In one case gastric function was depressed and in the other it was active The occurrence of carcinoma must have been unconnected with the original ulcers, for in neither case was there any digestive upset or premonitory symptom until a sudden onset of digestive trouble six to seven years after operation, while histological examination of the original ulcers proved their benign character

In ten cases the general health was fair, and efficiency could be described as about 50 per cent Six of these cases had microcytic anaemia and the complaints were those of the anaemia As there were nineteen cases of anaemia in the whole series it is seen that in thirteen—that is, in about two thirds of the anaemic cases—the anaemia was not producing any symptoms Apart from the tendency to anaemia in the cases where gastric function was depressed, there was no appreciable difference between the general health of those cases and of those in which gastric function was active It is of value to note that severe depression of gastric activity appears to affect adversely only the blood-forming mechanism and has no other ill effects on the general bodily processes

Four patients complained of abdominal pain in relation to food—one whose gastric function was depressed and three whose function was active Since there were fifty four cases (Polya and Schoemaker) in the former group and only thirteen in the latter it is evident that, while depression of gastric activity carries with it a risk of anaemia, it carries a greater certainty of freedom from ulcer symptoms It is generally considered that such freedom is associated with marked reduction or abolition of free acid, and this conclusion is in accord with our findings It is a most interesting point, for whereas acidity *per se* does not appear a sufficient explanation of the aetiology of peptic ulcer, yet marked reduction in free acid, and not merely removal of the ulcer bearing area, is necessary if risk of further ulcer symptoms is to be avoided so far as possible

Summary

1 Nine cases of Polya gastrectomy and fifty eight cases of Schoemaker gastrectomy were investigated more than four years after operation

2 Different degrees of depression of gastric activity were found, and the mechanism of this depression is discussed

3 Where gastric activity was severely depressed there was a high incidence of microcytic anaemia It is suggested that absence of free acid plus rapid emptying of the stomach may interfere with the absorption of iron and so cause anaemia

4 Depression of gastric activity was less severe after Schoemaker gastrectomy than after the Polya operation, and the incidence of anaemia was therefore correspondingly less after the former operation

5 Where gastric activity was not depressed there was a risk of further ulcer symptoms

6 The bearing of these results on the technique of gastrectomy is discussed

We wish to acknowledge our indebtedness to Dr J F Wilkinson, director of the medical research laboratory, at the

Manchester Royal Infirmary for allowing us to utilize the resources of his laboratory for this investigation

THE PROGNOSIS OF ANXIETY STATES

BY

ARTHUR HARRIS, B A, M D, D P M

Assistant Medical Officer St Bernard's Hospital Southall
Honorary Medical Psychologist West End Hospital
Child Guidance Clinic

Anxiety is regarded by McDougall (1936) as the emotion produced when in the course of striving towards some goal we doubt whether we shall achieve the desired end It is a derived emotion and sharply to be distinguished from fear which is a primary emotion Henderson and Gillespie (1936) define anxiety in the psychiatric sense as a fear of danger usually from within—that is impending physical illness Fear and anxiety seem clinically to be different degrees of the same emotion and may be regarded as pathological when they are aroused without reasonable cause

Pathological anxiety is a common feature of every form of psychosis and may be the most prominent one in the prodromal stages When it occurs as the sole abnormality apart from depression the condition is known as anxiety neurosis or anxiety state Lewis (1934) and Curran (1937b) have recently pointed out that anxiety is a common concomitant of depression and conversely, that depression is a common concomitant of anxiety, so that it is impossible to draw a sharp dividing line between depressive states on the one hand and anxiety states on the other No frankly psychotic syndrome however will be diagnosed as an anxiety state

Little has been written about the course of an anxiety state but many observers have noticed a strong tendency for hypochondriasis to accompany anxiety and with the passage of time partly to replace it one of the most comprehensive papers on the subject being by Brown (1936) Ross (1923) and Yaskin (1936), among many others consider that the development of a psychosis is exceedingly rare

Difficulty of Measuring Anxiety

In scientific work quantitative measurement is a necessity and consequently many efforts have been made to devise a measure of anxiety so far with little success Since mental processes cannot be measured the problem is usually attacked through the autonomic nervous system the close connexion between which and anxiety has been demonstrated by Cannon and his co-workers (1915) Jones (1936) finds that anxiety and sympathetic activity are apparently synonymous both being evoked by adrenaline and abolished by acetylcholine One method which has been regarded as very promising is that of the psychogalvanic reflex but Landis (1932) in a comprehensive summary of the literature states that quantitatively the method is useless although it is produced by sympathetic action, and in a later paper (1933) he envisages the possibility of a satisfactory technique being worked out Odegaard (1932) believes that an index of the vegetative emotional reaction in general can be obtained from it Solomon and Fentress (1936) however in a careful investigation found no correlation between the galvanic skin reflex and autonomic activity following on a previous paper (1934) in which they put forward the possibility of measuring bound and unbound energy Psychological methods have also been tried such as the measurement of the reaction time to word stimuli (Ebaugh 1936) but quantitative exactitude has not been claimed for them Culpin and Smith (1930) have found some correlation between a clinical estimate of anxiety and performance on the Schuster dotting machine

The above mentioned difficulty of measurement is most noticeable in the publication of results of the various modes of treatment such as baths massage and other physiotherapeutic measures (Engelhorn 1910) injection of polyglandular extracts (Leopold-Levi 1933) continuous narcosis (Strom Olsen and McCowan 1934), psychotherapy (Wenger 1934 Luff and Garrod 1935 Yaskin 1936 Neustatter 1935 Huddleson, 1927) and institutional treatment combined with psychotherapy (Ross 1936) Such terms as improved moderately improved and slightly improved are in general use although they are obviously unsatisfactory elastic and liable to variation according to the degree of optimism of the therapist concerned Ross (1936) Luff and Garrod (1935) Curran (1937a) and Neustatter (1935) have given definitions of these terms but none of them include details of the condition of the patients when first interviewed and the degree of improvement is not measured by objective standards

The prognostic studies of anxiety states published up to the present time fall into two groups the first of which is the above mentioned results of treatment Systematic follow-ups were not always undertaken but Luff and Garrod have traced their cases for three years and Ross some of his cases for five years and the rest for three years Both have used the method of follow up by letter Luff and Garrod have 220 anxiety states in their series and 30 per cent of the cases treated were untraceable Ross makes no distinction between hysteria and anxiety neurosis Nearly 50 per cent of his cases were untraceable

It is extremely difficult to compare these results on account of the differences in diagnostic grouping of cases criteria and classification of end results and methods but the percentage of cases whose progress was satisfactory varied between 40 and 80 and that of cases developing psychoses and committing suicide was always very small

The second group consists of clinical impressions and gives no figures For example Wechsler (1929) stresses the skill of the psychotherapist the age of the patient and the degree of introversion expressing the opinion that the illness in the case of female patients may stop at the menopause Karpman (1931) holds the view that the provision of psychotherapy of an analytical type is all important and Ross emphasizes the purposive character of the illness attaching considerable prognostic importance to the question of whether it is providing a satisfactory solution to the patient's difficulties or merely transferring

him from the frying-pan to the fire The last-named author also regards the personality of the patient as of great significance in this respect, especially his concept of himself ' Blessed are the humble, for they shall be cured " As a corrective to the assumptions of some writers Curran (1937a) studied cases which have received little or no treatment His main conclusions were that spontaneous recovery can occur and that there is no special liability to organic disease in these cases

There has been extraordinarily little attempt to make a statistical study of factors which may possibly affect the prognosis Luff and Garrod find that length of treatment and the age of the patient have little effect on the result, but that psychopathic heredity and adverse early environment are definitely unfavourable

The frequency with which organic conditions are misdiagnosed as functional is of considerable importance with regard to the prognosis of anxiety states and has been interestingly dealt with by Comroe (1936) Following the widespread acceptance of the implication of Cannon's work (1915) on the emotional reaction, many conditions previously recognized as having a vague neurotic background—such as nervous dyspepsia, the Army D A H, and mucous colitis—are acknowledged to be manifestations of pathological anxiety They are therefore very closely allied to anxiety neurosis or even identical with it Many workers go further and postulate the initiation of organic changes through disturbance of the autonomic nervous system Conditions the aetiology of which has been explained on these lines are gastro duodenal ulcer, ulcerative colitis, bronchial asthma, and the various allergic conditions, hyperpiesis, nephrolithiasis, rheumatism (Halliday, 1937), and many others The whole very extensive literature is well summarized by Dunbar (1935) The incidence of organic disease in patients suffering from anxiety states is therefore of interest, but the only inquiry into it that I can find is that of Curran

Objects of Present Investigation

The objects were threefold (1) To obtain a reliable follow up over a period of not less than ten years of an adequate number of cases of anxiety neurosis and to record the findings in readily comprehensible terms (2) To determine what factors affect the prognosis, so as to afford some guidance in this respect (3) To determine whether anxiety neurosis predisposes to any organic condition

Methods of Investigation

The cases chosen were those seen at the Maudsley Hospital during the years 1924, 1925, and 1926 in which the diagnoses were "anxiety neurosis," "anxiety state," anxiety, "anxiety with depression," and "anxiety hysteria ' Cases where the diagnosis was doubtful and given in some such terms as ' anxiety state, ? schizophrenia, ' were rejected, as also were four cases developing an agitated depression within a fortnight of admission to hospital Patients under the age of 15 at the time of their first visit to hospital were also rejected, as it was felt that the conditions termed anxiety states in children were not necessarily identical with the anxiety states of adults and that it would be confusing to group them together Patients over the age of 45 at the time of their first visit to hospital were also excluded, as it was felt that the many factors operative during the involutional period would be impossible to assess and would make the results difficult to interpret The procedure adopted was to send out a circular to all the patients concerned, inquiring after their health and asking them to call at the hospital if possible Where no reply was received a call was made at the address in question in an endeavour to see the patient, if he no longer lived there further efforts were made to trace him Finally, a list of the untraceable cases was sent to the Registrar-General and a search for them made in the register of deaths, also to the Board of Control with the object of ascertaining how many were in or had been in mental hospitals An interview with the patient was always sought, but proved impracticable in a few cases in which adequate information was obtainable in other ways—namely, an interview with a close relative who was living with the patient, a report from the hospital of which he or she was an inmate, and in one case a letter from her doctor in answer to a questionary The following examples will show how unreliable letters from patients can be

A married woman writes that her nerves are completely cured and that she is getting on very well When interviewed she complains of palpitation, shortness of breath, and extreme fatigability, ascribing these symptoms to her heart A cardiologist reports that she is a well compensated case of mitral stenosis and that her cardiac condition cannot possibly account for any of her symptoms

A single man writes ' I am fairly well at present in health I have been fairly well since I saw you as a patient ten years ago " He had actually been treated for schizophrenia for two years in a mental hospital and is now living with his parents in a docile, mildly demented condition

Classification of Cases

The above-mentioned difficulty of measurement was tackled by means of the following simple system of classification according to severity based on the social consequences of the illness It depends on the patient's reaction to the anxiety rather than on the degree of anxiety, but it is just this aspect to which the attention of both the patient and the community is usually directed

Grade 1 —Unable to pursue their occupations on account of anxiety symptoms and consequently supported by the Public Assistance Committee or by their relatives or friends

Grade 2 —Able to work and earn a living, but forced by their symptoms to modify their lives considerably, resulting in much limitation of their interests and activities

Grade 3 —Able to lead normal lives, but at times seriously inconvenienced by symptoms or suffering from some persistent phobia

Such a classification does not take into account the inherent strength of the patient's personality, as does that of Luff and Garrod It merely describes his reaction to his present environment I submit, however, that in the present state of our knowledge it is impossible to prophesy how a patient will react to varying circumstances with any degree of accuracy, and any attempt to do so is futile in a study such as this The distinction between Grades 1 and 2 is of the greatest social importance, both for the welfare of the community and for the preservation of the individual's position in it as a respected member The distinction between Grades 2 and 3 usually becomes apparent if one questions the patient as to whether he is prevented by his symptoms or fears from engaging in any normal activity For example, inability to go out alone, to walk along a crowded street, to talk to strangers, or to attend a cinema or football match would place a patient in Grade 2, whereas if he is able to do these things at the expense of occasional fits of palpitation, trembling, sweating, etc, he will fall into Grade 3 The test is what the patient can do rather than what he feels in the first

two grades The distinction between Grade 3 and normality on the other hand depends on the presence or absence of symptoms—a readily applicable criterion I have considered the inclusion of a fourth grade comprised of people who are not regarded by their companions or themselves as ill but have obviously unsatisfactory personalities and temperaments worrying over trifles dismayed by difficulties with pronounced hypochondriacal trends and so on I rejected the idea since the differentiation of such a group from the normal must depend entirely on the opinion of the physician and so can only result in the type of confusion that I am trying to avoid

In practice I found this system very easy to apply and closely related to the subjective feelings of the patient concerning the severity of his illness As an example of a case the grading of which was not obvious at first sight a married woman complained of a phobia of open spaces and large rooms By questioning her it was elicited that she was able to go out to do her household shopping but suffered from anxiety attacks in consequence She was fond of visiting her sister who lived some five or six miles away but rarely did so as she felt that the price that she would have to pay in the shape of unpleasant symptoms was too great She was unable to attend a performance in a large cinema near her home although she felt quite comfortable in the small ones It was obvious from this information that she fitted into Grade 2

When the material had been collected it was analysed with regard to the various factors that might conceivably affect prognosis Their incidence in the cases that recovered and in the cases that did not recover was determined and the two were compared A full medical history was taken in each case and particulars of any illness obtained from the patient himself and from any hospital where he had been treated

Results

A total of 259 suitable cases were discovered in the records and satisfactory follow ups were obtained in 123 cases Of these thirty eight were well, sixty were suffering from anxiety states nine had developed psychoses and sixteen were dead Five of those who had died were traced through the Registrar General and two of those who had developed psychoses were traced through the Board of Control Of the remainder 120 were untraceable ten were living out of London and six either were unwilling to be interviewed or their relatives were unwilling to show them the hospital letter in two cases due to fear of upsetting the patient on account of the bad state of his nerves The high percentage of untraceability is unfortunate and I think, due largely to the migrant habits of the London population a large proportion of whom live in lodgings and change them frequently

Patients Who are Well—Thirty four patients were interviewed, and in the remaining four the account of their present condition and their past history was obtained from the wife or mother of the patient As regards duration of recovery thirty two had been well for eight years or over so far as their neurotic illness was concerned one had been well for between five and eight years three for between three and five years and two for between two and three years All the Grade 2 and 3 cases except one had been well for over eight years

Cases Still Suffering from Anxiety States—Of the sixty patients in this group fifty four were interviewed in three other cases the wife was interviewed in two cases a report was received from the mental hospitals in which they were voluntary patients and in the case of the remaining patient who lived out of London her doctor was good enough to answer a questionary on her history and present state of health With regard to their present condition eleven cases were in Grade 1 twenty one were in Grade 2 and twenty eight were in Grade 3 Nine of the eleven patients in Grade 1 were very chronic cases and had done no work for ten years In only one case was the condition worse than that at the time of the first visit to Maudsley Hospital

Intermittent Cases—Three of the recovered cases had suffered relapses and eight of the anxiety states had undergone remissions It seemed in these to be a matter of chance whether they were classed as recovered or not according to the particular phase in which one found them at the time of the inquiry The duration of the remissions varied from nine months to eleven years This type of case accounted for half of the recovered cases who had been well for less than eight years It is worth noting that only eleven of the cases were intermittent and that only five other cases showed marked fluctuations in severity so that the state of these patients appears to be fairly constant It must be realized however that the source from which this information was obtained—namely the patients memory—was not really reliable

Cases which Developed Psychoses—The psychosis developed was schizophrenia in seven cases and recurrent depression in two cases In five of the schizophrenic cases from the notes made at the time the diagnosis of anxiety state seemed very doubtful and it is extremely probable that they represent mistakes in diagnosis One other has been treated for twelve years in the out patient department as a chronic anxiety state and has only within the last two or three months developed delusions of persecution of a bizarre type—an undoubted early schizophrenic reaction Two of the patients who appeared in the next group died in mental hospitals where they were under treatment for schizophrenia and agitated depression respectively It is impossible to be sure that all these cases were traced especially in view of the smallness of the number reached through the Board of Control There are many possibilities of leakage the chief being that psychotics may not be brought to the notice of the authorities

Patients Who had Died—The causes of death were suicide in three cases pulmonary tuberculosis in three cases chronic nephritis in two cases and in one case each accident cerebellar tumour thyroidectomy appendicitis and generalized peritonitis carcinoma of the breast carcinoma of the stomach and bronchopneumonia

Features of Prognostic Importance

I now come to the second object of my investigation—namely the discovery of which features are and which features are not of prognostic importance I will discuss each feature separately utilizing the ninety eight cases in the recovered and still anxiety state groups for the purpose

Table showing whether or not it was the Patient's First Attack of Neurosis

	Recovered	Still Ill
First attack	35	49
1 previous attack	1	7
2 or more previous attacks	2	4

Of the three recovered cases who had had previous attacks, two had suffered relapses since their visit to Maudsley Hospital and so are regarded as in the intermittent group In other words, only one of the fourteen patients who had had previous attacks made a satisfactory permanent recovery The occurrence of a previous attack therefore seems prognostically unfavourable for permanent recovery

Duration of Illness before First Visit to Out-patients Department in the Eighty four Cases where it was the First Attack

	Recovered	Still Ill
Under 1 year	21	12
Between 1 and 2 years	9	4
Over 2 years	4	33
Unascertainable	1	0

There was a recovery rate of 65 per cent in those cases where the duration was less than two years and of 11 per cent in those where it was over two years These figures are statistically significant Of the eleven cases at present in Grade 1 eight had a history of over two years duration before their first visit to the hospital

It will be seen that the prognosis is better and the patient is more likely to recover completely if the attack has not lasted for more than two years On the other hand the chances of complete recovery are small if the condition has lasted over two years, but the outlook for return to work is always quite good Nevertheless the possibility that the patient will persist in Grade 1 must be borne in mind, as this occurred in 24 per cent of the cases with a history of over two years

Severity of the Illness

Grade at Time of First Attendance at Hospital	Recovered	Still Ill
1	19	37
2	7	21
3	12	2

We see from this that the outlook in Grade 3 cases is very good, but that the outlook in Grade 1 and 2 cases is comparatively poor These figures are statistically significant

Amount of Treatment Received—On the whole more energy was expended before a Grade 1 case reached Grade 3 than in the return of a Grade 3 case to complete health The best results were obtained in cases which responded rapidly, and those which had required prolonged treatment were on the whole disappointing

Unfavourable Environment—I define 'unfavourable environment' as severe financial or family worries which would present serious difficulty to a healthy person—for example, desertion by a husband, prolonged unemployment, or much ill-health in children or spouse It was present in eight of the recovered cases and twenty two of the anxiety states during the past ten years—that is, 21 per cent and 37 per cent respectively It seemed, therefore, to have a less definitely adverse effect than one would expect, but the number of cases involved is too small for any importance to be attached to this finding

Psychopathic Family History—I define "psychopathic family history" as psychosis or severe neurosis—namely, definite nervous breakdown—in one or more parents or siblings It was present in thirteen of the recovered cases and twenty-four of the anxiety states—that is, 34 per cent and 41 per cent respectively This suggests that it is of no real significance from a prognostic point of view, but one must bear in mind the difficulty of obtaining accurate information from the patients (Slater, 1935) and the possible multiplicity of genetic factors involved

Obvious Precipitating Cause—It is commonly supposed that if neurotic illness has some obvious precipitating cause in the form of some definite psychic trauma the outlook is better than if it develops insidiously "out of the blue" Some physicians may be more ready to find a precipitating cause than others, but in this series of cases the out-patient officers appeared to have no individual predilections in this respect It was present in six of the recovered cases and twenty-two of the anxiety states, so that if any conclusion can be drawn from such a small number of cases it does not appear to be a favourable prognostic factor The patient will always tend to exaggerate the part played by the trauma, which must be a matter of some doubt There was one case in which the condition was precipitated by head injury and which made a good recovery, but I regard it as in a different category from psychic traumata

The Menopause—There were six cases in which the onset of the disease was at the menopause Four of these recovered and two were still "anxiety states" Three of the recovered patients have subsequently reached the menopause, none of them experienced any return of symptoms at that time Twelve of the "anxiety states" have subsequently reached the menopause, and only one of these experienced any exacerbation of symptoms during it

Pregnancy—Of the nulliparae who have had children since their first attendance at hospital three recovered completely Two of the patients dated their recovery from a pregnancy and two "anxiety states" described spontaneously, as a curious fact which they had noted, that they experienced a remission during pregnancy and that their anxiety returned within about a fortnight of their confinement This affords some slight indication that pregnancy may exercise a beneficial effect

SYMPTOMATOLOGY

Efforts were made to group these cases according to their symptomatology—namely, the predominance of neurasthenic symptoms, hypochondriacal symptoms, etc—but every scheme tried proved unworkable on account of the great variety of symptoms and the multitude of combinations in which they appeared It was possible, however, to isolate a small group of twelve cases in which the anxiety was not diffuse, as in the majority, but concentrated in definite phobias or clear cut anxiety attacks, suggesting a mechanism analogous to the conditioned reflex Three of these recovered and nine persisted as anxiety states Examination of individual cases showed that definite phobias and clear-cut isolated anxiety attacks tend to persist longer than generalized anxiety and militate against complete recovery They not infrequently remain as residual symptoms in cases which have improved from Grade 2 to Grade 3, for example

The chief factor in the determination of the symptomatology seems to be the personality of the patient The outcome in markedly introverted patients appeared quite good, and certainly no worse than in the rest Personality traits of the type generally known as psychopathic, shown by persistently inadequate response to difficulties or anti-social behaviour, were definitely unfavourable, and many of these patients persisted in Grade 1

OTHER FACTORS

Other possible prognostic factors investigated were sex, age, civil state, occupation, and physique on the lines indi-

cated by Kretschmer (1925) and by Draper (1930) but no significant results were obtained The figures are given in the following table

	Recovered	Still Ill
Sex		
Males	17	18
Females	21	42
Age at onset of illness		
15 to 25	12	16
25 to 35	13	29
35 to 45	13	15
Civil state		
Married women	12	29
Single women	6	9
Women married since first attendance at hospital	3	4
Married men	13	12
Single men	2	3
Men married since first attendance at hospital	2	3
Occupation		
Women Housewives	15	29
Office and shop workers etc	3	9
Factory and domestic workers	3	4
Men Office and shop workers	6	4
Artisans	9	11
Labourers	2	3
Physique		
Pyknic	11	14
Leptosomatic	15	34
Athletic	8	6

I must now turn to the third object of my investigation—namely the physical diseases to which these patients are liable

PHYSICAL DISEASES DEVELOPED BY THE PATIENTS

In only one case does the error of regarding an organic condition as functional appear to have beeen made the patient dying a year later of compression of the medulla by a cerebellar cyst The organic illnesses developed by the ninety-eight patients in the recovered and anxiety state groups subsequent to their first visit to Maudsley Hospital were as follows gastric ulcer with subsequent pyloric stenosis successfully treated by operation one case haematemesis of unknown origin (in spite of full investigation) one case gastric carcinoma, one case arthritis four cases muscular rheumatism five cases cystitis, two cases, renal calculi one case toxaemia of pregnancy one case eczema two cases urticaria one case herpes zoster one case phlebitis two cases pneumonia two cases salpingitis one case small pox one case diphtheria one case Laparotomy was performed in four cases with no benefit to the patient in spite of division of adhesions slinging operations etc Acute appendicitis occurred in one case and removal of nasal polypus and resection of septum was necessary in one case An operation for hernia was performed in one case tonsillectomy in two cases colporrhaphy in one case and myomectomy in one case The blood pressure was taken in every case seen and definite hyperpiesis (180/100 or over) was found in five cases four of which were suffering from anxiety states while the fifth had extensive renal damage due to calculi but no neurosis There were no cases of bronchial asthma or hay fever and the sole representative of the whole allergic group was one rather doubtful case of urticaria alleged by the patient to have been diagnosed as such by his panel doctor The syndrome of vagotonia was carefully looked for, but nothing resembling it was seen except in one case a man who was subject to fainting fits with a pulse rate in the neighbourhood of 65 On the other hand the rapid labile pulse dilated pupil and moist skin of sympathetic overaction was common in the anxiety states as was only to be expected Hyperthyroidism was observed at the onset of four cases although they now show no signs of it and three of them are classified as recovered As regards functional somatic symptoms severe dyspepsia occurred in eighteen cases and nervous diarrhoea in two cases one of which subsequently progressed to mucous colitis We see therefore that twenty-one cases were severely troubled with gastric symptoms but that in only three of them was there evidence of an organic lesion The patient who had carcinoma suffered from gastric symptoms for only six weeks before his operation

The incidence of arthritis of various types seems rather high as also does that of muscular rheumatism —that is vague pains and stiffness in various parts of the body and actually nearly 10 per cent of the cases (nine out of ninety-eight) in the groups recovered and anxiety states had suffered severe disability at one time or another from some disease of the rheumatic group *However quoting from a Report of the* Ministry of Health (1924) 2·76 per cent of the total list strength were attended by their insurance practitioner for rheumatic disease in the year 1922 alone so that it is probably no higher than among the general population

Four of the cases of hyperpiesis were in the age group 35 to 45 and the fifth was in the age group 25 to 35 There were nineteen cases in the age group 15 to 25 which can be presumed to be immune from the development of hyperpiesis leaving seventy nine cases in the age groups 25 to 35 and 35 to 45 This gives an incidence of 6 per cent not a strikingly high figure I think that the absence of vagotonic and allergic disturbances is noteworthy and feel that there must be a sympathetic overactivity in these patients which prevents their appearance A mild degree of hyperthyroidism is not uncommon in a recently developed anxiety state but calls for no special treatment and does not affect the prognosis

Concerning the observations that anxiety in the course of time tends to be converted to hypochondriasis I found some cases in which this was a striking feature It was by no means universal however and did not occur in the majority of cases Six of the recovered cases and ten of the anxiety states give evidence of hypochondriasis at the present time the percentage of the total being 16·5 It may seem somewhat anomalous to *talk of hypochondriasis in patients who are well but I* have done so in the type of person who complains of no symptoms but is unduly fussy about his diet or other matters supposedly affecting his health

Summary and Conclusions

An attempt was made to ascertain the present condition and past history of 259 cases which had been diagnosed as anxiety states between ten and twelve years ago From the material collected a search was made for features of prognostic significance and for any evidence of increased susceptibility to organic disease Of the cases 46 per cent were untraceable and 6 per cent were traceable but inaccessible so that a satisfactory follow up was obtained in only 48 per cent Of these 31 per cent were well 49 per cent were suffering from anxiety states 7 per cent had developed psychoses and 13 per cent were dead It is probable that the great majority, if not all of those who had died were traced

The main prognostic points elicited were as follows Anxiety and its clinical manifestations may persist unchanged for ten years and over, and the percentage of cases in which it is converted to hypochondriasis is small The prognosis is fairly good if the condition is of less than two years duration, and, conversely, it is poor but not hopeless for ultimate and permanent recovery if the condition is of longer than two years standing On the other hand, the patient s chances of returning to work are always quite good, as only 20 per cent of those unable to work persisted in that state If the patient's habits or mode of life remain substantially unchanged by the anxiety the prognosis is good The outlook in cases with markedly psychopathic personalities is poor

There was no evidence of increased susceptibility to organic disease in these patients

The difficulties and possible fallacies are discussed

At the International Congress of Microbiology in London in July 1936 Professor Johan stated that as a result of the successful immunization against diphtheria of large numbers of children in Hungary a law making immunization compulsory would probably come into force in 1937 The English text of the Order is now available and public health experts will watch its operation with close interest Immunization, apparently with three doses of toxoid, must be carried out in the second year of life and again in the sixth year, unless the child has suffered from diphtheria, or undergone an equivalent series of injections or is excused because of illness Curiously enough there is no mention in the Order of immunization with alum toxoid which is effective in two doses, nor of Schick testing either before or after immunization

THE OBSTETRICAL "FLYING SQUAD"*

BY

E. FARQUHAR MURRAY, M D., F.R.C.S.

Professor of Midwifery and Gynaecology University of Durham College of Medicine

The emergency service—the so called "flying squad"—is now an essential part of a modern maternity service The expert attention, and the surgical and other adjuvants which are included in the outfit, meet a long felt want

The bulk of midwifery in this country is conducted in the homes of patients, the majority of whom are not in a position to pay for expert service This knowledge has often handicapped the doctor in charge of the case, who has had to tackle major problems single handed or to send the patient into a maternity hospital

Expert service before the war, so far as working class patients were concerned, was mainly immobilized in maternity hospitals Post-war there has been a slow relaxation of this system Health authorities offered consultations in puerperal pyrexia, and very gradually a more extended service of expert advice or assistance was offered at all stages This is still far from being universal or comprehensive In the Newcastle area, with few exceptions, the authorities offer the doctors a fully comprehensive service at all stages

The emergency service, which is everywhere adopted in that area, is a something by itself The essential points are that expert attention is immediately forthcoming, while the outfit, which is accompanied by a nurse, contains all reasonable surgical requirements and also those things which are often lacking in an industrial household, such as blankets, hot-water bottles, basins, and so on It is especially designed to deal with those acute crises which may occur in the most carefully supervised case but are more liable to happen in the present somewhat disjointed system of maternity service Shock and post partum or ante-partum haemorrhage are typical examples of the cases most urgently in need of such a service, but threatened or actual eclampsia and difficult labours or "failed forceps" cases would derive benefit also

It is obvious that expert service given on the spot to a patient who is shocked and collapsed from post partum haemorrhage and with a retained placenta is preferable to the delay and handling of a desperately ill woman entailed by sending her in an ambulance to hospital For local calls the service can be in the patient's house as soon as an ambulance would be likely to arrive, and for distant calls long before the patient could have reached a hospital

Working of the Service

A doctor faced with an emergency sends a message to the maternity hospital giving his name, the name and address of the patient, and the name of the consultant on the panel he wishes to attend He may also give some details of the nature of the case This message is sent by private telephone or by a telephone kiosk, or by one of the police-box telephones On receipt of the message the hospital telephones for a taxi and details a nurse to go with the outfit, which is kept packed and ready The consultant is telephoned, and if he is not in then the others on the panel are approached When one is ob

* Read in the Section of Obstetrics and Gynaecology at the Annual Meeting of the British Medical Association, Plymouth 1938

tained he is given the message, and goes direct to the patient's house taking his usual outfit with him

There is a friendly rivalry as to whether the nurse or the consultant will reach the patient first On arrival at the case the nurse discharges the taxi which can be sent for when necessary For cases over five miles from Newcastle the consultant calls at the maternity hospital and takes the nurse and outfit with him in order to save needless transport charges The nurse detailed is usually one of the district staff nurses but a more junior nurse is occasionally sent It is most important that the outfit should be clearly labelled with details of the contents of each package so that a nurse unacquainted with its contents can find them readily The Newcastle outfit consists of a large tin a large package a drum and some oddments such as a cylinder of oxygen and a container of gum saline It can easily be carried in the boot of a motor car

The panel of four is composed of those engaged in private consulting practice in the city For consultations other than emergency doctors make their own arrangements direct with the consultant as in private practice

The outfit with a nurse in attendance has been placed at the disposal of the Newcastle doctors since it contains many things that might be most useful in a difficult case and yet not one that requires the presence of an expert Those doctors using it have to be responsible for the fee for the use of the outfit and for transport charges

The service started in October 1935 and there was only one call that year In 1936 there were eleven calls and in 1937 twenty one calls There were thirteen calls in the first half of 1938 A steadily increasing demand is made on the service but not nearly as large as it should be Badly shocked exsanguinated and sometimes moribund women are still sent to hospital from time to time In 1936 eleven women were admitted suffering from shock and loss of blood mostly due to placenta praevia and died within a few hours of admission It is impossible to believe that some of these deaths could not have been avoided had the emergency service been called in

Certain of these disappointments are explained by failure of the authorities to give the service sufficient publicity The profession is a constantly changing one and annual reminders should be sent out There is also the instinctive tendency to ignore literature received in open envelopes with halfpenny stamps Other disappointments are due to the deep-rooted belief in hospitals and the marvels that they can accomplish held by the relatives who no doubt bring pressure to bear They are unaware that the residential staff may only be a very junior house surgeon Another factor is a dread on the part of certain doctors that the patient will be required to pay a part or the whole of the charges incurred by calling in what is believed to be a free service Whatever the explanation, my colleagues and I are convinced that we have saved a number of lives—and in just such cases as those which simply cannot be saved when first seen at the maternity hospital

Cases Attended

The service was called to forty-six cases as follows One or two were purely consultative

P P H	2	Failed version	1
P P H and shock	11	Prolonged labour	1
Retained placenta	5	Prolapse of cervix	1
Retained placenta and P P H	7	Pulmonary embolism	1
Miscarriage and haemorrhage	9	Ruptured uterus	1
Septic abortion	1	Collapse	1
Failed forceps	4	Acute yellow atrophy	1

Results

There were five deaths among those treated the causes were as follows

1 Obstructed labour due to a double monster When first seen the patient was moribund

2 Collapse some days after an abortion The patient was dying of hyperacute sepsis

3 Acute yellow atrophy The patient died some days later

4 P P H and shock with retained placenta The patient had a huge fibroid which was mistaken for a second child She got over the immediate danger but the fibroid became infected and she died some three months later when an attempt was made to remove it.

5 Failed forceps case The patient was exhausted and shocked and the foetus was anencephalic She appeared to get over the confinement but collapsed suddenly next day The cause of death is uncertain

Apart from these deaths most of the other patients were exhausted and in many instances badly shocked and even exsanguinated Some were described as fainting and pulseless Not one of these patients was lost In nine cases they were so critically ill that they could not be moved merely restorative measures were employed and occasionally some slight operative procedure was performed and when they had sufficiently recovered they were removed to hospital some hours later for nursing and possibly further treatment In a number of cases an extensive repair was carried out after dealing with the urgent symptoms

Expenses and Fees

As regards expenses there is a charge of one guinea for the use of the outfit with the nurse in attendance This is payable to the hospital as also are any transport charges incurred The fees payable to the consultant are based on the agreement we have with the individual authority for general services Northumberland County Council pay the following fees

> A primary consulting fee of two guineas with a mileage rate for every mile travelled going and coming of 2s 6d (3s between 9 p m and 9 a m) Operative fees are additional and range from six guineas for an abdominal operation to two guineas for a transfusion Forceps deliveries repairs versions and removal of placentae are intermediate in cost

It would interest those present to know that for some years past we have had a fairly comprehensive service agreement with both the Northumberland and the Durham County Councils Recently they have both adopted the emergency service In 1935 the panel of four consultants received a grand total of £126 from the former county and in 1936 roughly £200 from the latter The advent of the emergency service will only add a very little to the expenses incurred by these authorities

Conclusion

The need for such a service was advocated by me in the *British Medical Journal* of April 13 1929 and in *Public Health* the same year I find that Bellshill gave a practical trial of the suggestion in 1931 Newcastle was the first medical school centre to put it into operation Its running is simplicity itself but for efficiency there must be a central call office responsible for receiving the messages The panel should consist of all the recognized consultants in the work in any area who care to serve In more outlying areas the panel could comprise those general practitioners conversant with obstetrics who

commend themselves to their local colleagues in a consultant capacity The details of the outfit can be elaborated or amended according to the wishes of those who use it

I feel convinced that a modified outfit should be at the disposal of every doctor and midwife, to make good the deficiencies of many industrial homes Some emergencies are preventable, and will tend to be eliminated by the improved standard of medical and nursing supervision which is being developed and by the closer co operation which will result between the two services

Outfit for the Emergency Service

This outfit is contained in (i) a bundle, (ii) a square case, (iii) a drum, and (iv) oddments

Bundle (weight 21 lb measurements 20 × 10 × 10 in)

- 2 brown blankets
- 2 sheets
- 4 hot water bottles
- 2 mackintoshes (1 sheet, 1 apron)
- Bed pan
- Rectal saline apparatus
- Tin containing 1 oz glucose

Square case (weight 27 lb, measurements 20 × 10 × 10 in)

- 2 pint measure
- 1 small and 2 large basins
- Obstetric straps
- Flask of sterile water
- Saline tablets
- Lotion thermometer
- 2 sterile dressing towels and mackintosh
- 1 hand towel
- 1 pair of sterile gloves
- 1 bag of sterile swabs
- 2 pairs dissecting forceps
- 6 pairs artery forceps
- 3 scalpels
- Needles
- Aneurysm needle
- Scissors
- Kidney dish
- Nail brush
- Intravenous saline apparatus
- Intra uterine douche apparatus with Bozeman's nozzle
- Hypodermic syringe
- 10 c.cm. Record syringe
- Sims's speculum
- Catgut
- Silkworm gut
- Rubber catheter
- Dettol
- Pituitary
- Erbolin
- Morphine digitalis strychnine, lobeline
- Atropine
- Brandy
- Adrenaline
- Camphor in oil
- Tinct. iodine
- Spirit soap
- Anaesthetic mask
- Methylated spirit
- Coramine
- Minim measure
- 2 oz. measure
- Novocain
- Chloroform
- Ether
- Drop corks

Drum (weight 12 lb height 10½ in, circumference 32½ in)

- Wool
- Gauze (2 rolls)
- Lint
- Gloves (2 pairs)
- 2 sterile gowns
- 2 sterile masks
- Doctor's hand towel
- 4 dressing towels

Oddments

- Oxygen cylinder with tubing and funnel
- Flask of gum saline
- CO_2 apparatus for babies

SEPTAL DEFLECTION*

BY

W. S. SYME, M.B., Ch.B., F.R.F.P.S.

Assistant Surgeon Ear Nose and Throat Department, Western Infirmary Glasgow

I have for some time had an uneasy feeling that there is a tendency to blame this deformity for many more ills than it deserves and consequently to employ operative correction much more often than is actually necessary Let me admit at once that there are many reasons for this A twisted septum is a definite, quickly seen abnormality and a handy explanation of many ills of obscure origin The operation of submucous resection is a pleasant and straightforward one—being, in fact, the favourite operation of many specialists It does not cause extreme discomfort for the patient, and, if performed with care according to reliable technique, does not result in any lasting harm So that even in the case of the most careful and scrupulous among us a septum bent or a little to one side is sometimes an undisguised blessing

This paper is based on an investigation of a series of cases in which a diagnosis of septal deflection was made by various examiners The frequency with which deflection occurs to a varying degree with or without ill effect would suggest that it is not the condition of the septum which causes disease but the liability to congestive and infective processes in the presence of a narrowed airway How often are we right in assuming that this irregularity in development requires to be changed artificially by operation? And are we not too frequently apt to forget the compensatory character of Nature? It is often only during a routine examination of the nose that a septal deflection is discovered with no associated complaints of obstructed breathing, headache, catarrh, etc This state exists in many cases with very severe deviation Other factors must therefore be present to give rise to the conditions commonly credited to a septal deflection With regard to its frequency, are we right in saying that because the nasal septum is not exactly in the middle line it is abnormal? At any rate in European skulls and on clinical examination it would seem to be more the rule than the exception, the percentage being variously quoted as between 60 and 80 It has been seen in infants of a few weeks old, occurring more often in males than in females and slightly more to the left than to the right For some reason it is the exception in aboriginal skulls is this because of a purity of racial development, whereas through the ages many races have combined to give the European his ultimate size and shape? The majority of septal deviations are not associated with disease or discomfort

The Role of Trauma

With regard to the origin of septal deviation, few of the patients examined in this investigation can recall an injury likely to have been the cause Opinions differ very greatly as to the part played by trauma, some say it is the common cause, others that it is the exception It certainly seems possible for many injuries to the nose to occur in early childhood—as in falling, for example—that would not be recollected in adult life Such injuries may twist the cartilage without external change, and, in fact, traumatic changes will be found mostly in the cartilage Although it is impossible to say how far injury has influenced the development, there remain, I think, a majority of cases in which the origin would seem to be developmental And why not? Should the septum be the one structure to be absolutely straight and in the dead centre? Superficial examination, even a casual glance, will show that none of us has two equal sides to the face It is interesting to note, on radiographing the skull, how often a difference in size exists and how often a septum is deflected to the smaller side The nasal cavity, turbinals, and sinuses are frequently noticeably smaller on the convex than on the concave side It does not necessarily follow, because of the high percentage of septal deviations, that there is a perceptible difference between traumatic and non traumatic causes in this regard Acceptable suggestions as to the cause include defective development of the septum itself and its upper and lower boundaries This would occur with the high palate so common as the result of adenoids, with an abnormally low cribriform plate and flat nasal bridge, and is even more likely still when both these conditions exist

Effects of Septal Deflection

Unless so great as to be noticeable externally, a septal deviation attracts attention by interfering with breathing and the drainage of the nasal cavity and sinuses Middle

*Read in the Section of Oto Rhino Laryngology at the Annual Meeting of the British Medical Association Plymouth, 1938

ear and tubal conditions, especially catarrhal ones are found with great frequency in association with septal deviation but the suggestion is made that these are most commonly seen after the establishment of sinus disease When severe it may cause pain by pressing on the lateral nasal wall The blockage of sinus drainage is by far the most troublesome effect and the one calling most persistently for relief In these cases the septal deflection is commonly most acute high up and many probably the majority are the result of injury Is there any difference between the effect of a sudden change of the size and shape of the nasal cavity by traumatic deviation of the septum and the result of a septum deflected during development? It seems reasonable to suppose that given equal conditions of infection the case with a traumatic deviation of the septum will be likely to have more trouble from a sinusitis than the developmental case or the case of long standing In the former there is not only the effect of the trauma but also the larger turbinals In the latter there has been an accommodation of structures and functions to meet the irregularities as for example the shrinking or the smaller development of turbinals Why does a septal deflection produce a greater liability to disease? A sudden traumatic change in aeration and drainage is understandable as a cause of trouble but in regard to other bodily aberrations are the parts concerned more susceptible to bodily disease than those absolutely normal? If so and if the septal deflection is looked upon as an abnormality then those liable to disease from this cause are in the majority There certainly seems to be a tendency for diseased conditions such as sinusitis to be found more often on the side of the septal deflection Is this definitely due to the presence of the septal deflection or does the septal deflection not rather make drainage difficult and so the relief of disease and symptoms? Is not sinus disease at first part of an ordinary rhinitis, showing itself as an entity only when the resolution does not progress as in the nasal cavity itself? In those cases of septal deflection with no symptoms Nature has made compensation for the difference in size of the two nasal cavities—for example the larger inferior turbinal on the concave side The position of the septum does not seem to have any pathogenic effect its action is purely physical and is shown after the onset of disease especially by interfering with efficient drainage of sinuses

Grounds for Operation

It is interesting to wonder on what grounds we should perform submucous resection of the septum I suppose most of us would agree that a badly deflected septum obviously obstructing breathing to the patient s discomfort a similar septum preventing the drainage of sinuses and impeding the return of the patient to good health or a septum by its pressure on opposing surfaces causing acute pain are all circumstances warranting procedures for moving the septum out of the way Most of us would agree that the operation of submucous resection in one form or another is best suited to this purpose Attention to the septum in this way will reduce the necessity for turbinotomy to a minimum Apart however from these more insistent conditions many minor disorders of the nose and its vicinity are found in conjunction with a septal deflection where the question of operating on the septum also frequently arises Possibly in this group of cases our tendency is to interfere too often with the septum and it is I think here that the results of such interference do not seem to favour it The results at any rate in some hands are disappointing and I believe for at least two reasons First the psychological one—both for ourselves and for our patient—that although generally no harm is done our surgical procedure has not removed the original disorder Secondly that owing to the presence of so definite a condition as a septal deviation many minor but more persistent disorders escape our notice Even although so many deflections produce no symptoms can we with one such individual ever be right in advising the straightening of the septum as a preventive of serious disease in view of the ever present possibility of nasal infection or should we rather wait for the acute symptoms to arise and then do our submucous resection in case trouble should arise again? This is an age of prevention in medicine but I think there will be few among us who would be willing to go to these extreme lengths just in case

CALCIUM MANDELATE AND SULPHANILAMIDE IN TREATMENT OF URINARY INFECTIONS

BY

H DROLLER, M D Munich, L R C P Ed

Clinical Assistant Medical Department Royal Infirmary Sheffield

Mandelic acid has its well defined indications in the treatment of urinary infections It is most efficacious against *B coli* and enterococci but usually fails in *B proteus* and staphylococcal infections Schnohr (1937) Hryntschak (1937) Melton and Rosenheim (1938) and Kunstmann (1938) report series of cases treated with the calcium salt of mandelic acid This salt is an insoluble tasteless powder which does not mix with water and can be given with milk or jam Calcium mandelate is marketed by British Drug Houses as mandecal and this was the preparation used in the present series of tests

Recently the group of compounds of which sulphonamide prontosil, and streptocide are the best known members has been used extensively in the treatment of urinary infections (Garrod 1938 Cokkinis 1938) To compare the efficacy of calcium mandelate with the sulphonamide group of urinary antiseptics we took two series of cases of urinary infections and tried to treat each series according to indications set out below with the respective drug

Indications for the Use of Mandecal—Mandecal has the same indications as all the other mandelates The renal function should be good so that the urine may speedily attain a *p*H of 5·5 or less Mandecal is most effective against *B coli*

Indications for the Use of Sulphanilamide—Sulphanilamide exerts its bacteriostatic action best in an alkaline medium The kidney function may be good or moderately impaired It is equally effective against *B coli* haemolytic streptococci and *B proteus* It does not act on enterococci

Two questions arise Which drug fulfils the optimal requirements in sterilizing the urine in the shortest time with the least amount of toxicity in a given infection? and Which treatment is the cheaper?

1 Mandecal

Mandecal was found to acidify the urine of healthy individuals very quickly In a self experiment the urine became strongly acid within eighty minutes of the in

gestion of 4·5 grammes of mandecal (*p*H 7·6 to *p*H 5). On ingestion of mandecal, free mandelic acid is rapidly and almost completely excreted by the kidneys the calcium is fixed to an acid radical and an acid urine is excreted to maintain the acid-base balance

TABLE I—*Cases treated with Mandecal (71 per cent Cures)*

Type of Case	No	Cures	Failures
(1) Chronic urinary infections	12	9	3
Pyonephrosis	1	—	1
(2) Urinary infection occurring together with			
Chronic nephritis	1	—	1
Focal nephritis	1	1	—
(3) Hypertension	2	2	—
Microcytic anaemia	2	1	1
Rheumatoid arthritis	1	—	1
Diabetes mellitus	3	2	1
Ulcerative colitis	3	2	1
Various conditions	5	5	—
Total	31	22	9

Causative Organisms—In all but two cases *B coli* was the organism concerned, the exceptions being two mixed infections one with enterococci and haemolytic streptococci, the other with *B coli* and haemolytic streptococci

Clinical Results—Using a standard dosage of 4·5 grammes of mandecal four times daily, we could prove that calcium mandelate acidifies the urine sufficiently to be an effective urinary antiseptic The salt is pleasant to take, and in no case was the vomiting noticed which is so common after ammonium mandelate medication The cases treated have been divided into three groups (1) those showing signs and symptoms of cystopyelitis, (2) those suffering from haematogenous bilateral renal disease and concurrent urinary infections, and (3) cases in which a bacilluria was discovered on routine examination, without clinical symptoms of urinary infection Those cases in which treatment failed are shown in Table II

TABLE II—*Cases in which Treatment Failed*

Diagnosis	Urine Culture	Duration of Treatment	Remarks
Group 1		Days	
Cystitis (male aged 52)	Heavy mixed inf enterococci and haem strept	10	
Pyelitis (female aged 5)	Moderate growth of coliform bacilli	17	Urine difficult to acidify lowest *p*H 6·7
Cystitis (male aged 21)	Heavy *B coli*	12	*p*H never below 6·1
Cystitis (male aged 20)		10	
Group 2			
Chronic nephritis	*B coli* and haem strept	10	Could not concentrate sufficiently S G 1010
Group 3			
Microcytic anaemia	*B coli*	11	
Rheum arthritis	,,	14	
Ulcerative colitis	,,	14	
Diabetes mellitus	,,	5	Left ward before investigations were finished

The duration of treatment varied from three to twenty-six days, the average being nine days Hryntschak is of the opinion that calcium mandelate should not be used for periods longer than ten days, but I have never observed any nausea coming on after this time No toxic symptoms were noticed, and the only difficulty encountered in taking the powder was due to the fact that mandecal floats on water

The results compare favourably with those obtained with ammonium mandelate (Holling and Platt, 1936, Kunstmann, 1938) Hryntschak and Rosenheim both agree that mandecal is easier to take and less nauseating than ammonium mandelate, Kunstmann, however, found it less palatable We can fully confirm the former authors' findings

The cost of treatment with mandecal for a period of seven days amounts, according to the manufacturers (B D H), to 8s 4d (hospital price)

2 Sulphanilamide

Since 1935 the number of favourable reports on the treatment of urinary infections with sulphanilamide has been steadily growing This drug has the advantage of rendering the urine slightly alkaline (Marshall *et al* 1938), and can be used during the acute stages of pyelitis and cystitis It is directly bactericidal, and is more active in an alkaline medium (Helmholz, 1937a, 1937b)

TABLE III—*Patients treated with Sulphanilamide (75 per cent Cures)*

Type of Case	No	Cures	Failures
Acute pyelitis	2	2	—
Chronic pyelitis	3	1	2
Chronic urinary infection	2	2	—
Urinary infection combined with Acute nephritis	2	2	—
Chronic nephritis	2	—	2
Chronic peritonitis	1	1	—
Diabetes	3	2	1
Myxoedema	1	1	—
Ulcerative colitis	1	1	—
Pulmonary tuberculosis	1	1	—
Rheumatoid arthritis	2	2	—
Total	20	15	5

Clinical Results—A standard dose of 1·5 grammes of sulphanilamide a day was used, as suggested by Kenny *et al* (1937) Only one toxic sign was noticed—namely, cyanosis It occurred in three cases one was an acute nephritis, the other two being chronic renal failure where isosthenuria already existed All three patients lost their cyanosis quickly after cessation of treatment with sulphanilamide The cases were again divided into three groups in the same manner as those treated with mandelate

Failures

Chronic cystopyelitis in a man of 52, heavy mixed infection with enterococci and haemolytic streptococci Treatment was continued for only ten days because the patient left hospital (Previous mandecal treatment without success)

Chronic pyelitis in a man of 34 Left hydronephrosis, right kidney not functioning at all Enterococci and lacto-fermenting coliform bacilli Patient developed cyanosis drug stopped on tenth day Chronic nephritis Both this and the previous patient were already beyond an expectation of cure Both had isosthenuria and rising non protein nitrogen One was a case of mixed infection with haemolytic streptococci, the other with enterococci and coliform bacilli, the latter developed cyanosis after seventeen days treatment when the drug was discontinued

Diabetic cystitis in a female of 65 due to *Staph aureus* Treatment for a fortnight did not remove the infection This is interesting in view of a finding of Becker (1937) who reported good results in staphylococcal cystitis

The duration of treatment varied from three to twenty-seven days with an average of ten days The cost of treatment was about 6d (hospital price)

Causative Organisms in Sulphanilamide Series

	Cures	Failures
B coli	8	—
B coli and haem strepts	3	1
B coli and enterococci	1	2
Enterococci and haem strepts	—	1
B coli and *B proteus*	3	—
Staph aureus	—	1

(The mandecal series with only two exceptions contain infections with *B coli* according to the indications set out above)

Conclusions

The danger of neglecting urinary infections is only slowly being realized Evidence is accumulating that when they are insidious in their onset they may lead to a form of renal failure with contracted kidneys which shows certain typical pathological changes (Fahr 1938) It is therefore necessary to treat all cases of urinary infection however slight until the urine becomes sterile

Two drugs are at our service Mandelic acid is indicated in chronic infections with good renal function and concentrating power in the presence of pure *B coli* infections The calcium salt of mandelic acid is more pleasant to take and is as efficacious in sterilizing the urine as any other mandelate The sulphonamide group of drugs is indicated in mixed infections and in the presence of haemolytic streptococci and *B proteus* Mandecal shows no toxic symptoms at all whereas sulphanilamide in the dosage indicated brought on cyanosis in only three cases No other toxic symptom was observed

Summary

An account is given of two series of cases of urinary infection treated with mandecal and sulphanilamide respectively Cures were obtained in 71 per cent of the mandecal and 75 per cent of the sulphanilamide series

I wish to thank Dr R Platt for his kind criticism and for his permission to publish this paper I am also indebted to British Drug Houses Ltd for a supply of mandecal

H J Burstein (*Urol cutan Rev* 1938 42 575) records a case of double kidney with Y-shaped ureter and ureteral calculus in a female infant aged 18 months in whom nephrectomy resulted in a cure The child was in good health a year after the operation The condition was an embryological malformation and the symptoms of frequent micturition pyuria and fever were due to hydronephrosis infection and stone formation The diagnosis was made by careful examination including cystoscopy retrograde pyelography and intravenous urography In the differential diagnosis congenital hydronephrosis congenital idiopathic dilatation of the ureters congenital ureterocele hydronephrosis due to anomalous vessels and other causes and polycystic disease of the kidneys had to be excluded.

Clinical Memoranda

Localized Hypertrophic Emphysema

One of the debated causes of hypertrophic emphysema is often said to be intermittent or partial bronchial obstruction and in this relation the following case may be of interest

Case Report

A Hindu of 28 years was killed in a motor-car accident reliable evidence stating that there were no respiratory movements when the body was examined immediately after the collision His health was stated to have been good with the exception of a spasmodic non productive cough which he had had for some months and which came on at weekly or fortnightly intervals and lasted for half an hour or more

At post mortem examination nine hours later the cadaver was that of a well nourished adult There were severe abrasions and contusions on the forehead right cheek occipital and suboccipital regions There was fairly extensive basal haemorrhage and laceration of the pons In addition however the postero-lateral segment of the middle lobe of the right lung had a number of small bullae on the surface and it was much softer than the remainder of the lung On dissection it became evident that a well-defined part of the right middle lobe was emphysematous The bronchus supplying this section was traced and just distal to its junction with the main bronchus to the middle lobe a small flap of the mucous membrane was found The bronchus was three eighths of an inch in diameter and the flap which was one tenth of an inch in thickness occluded five eighths of the bore of the bronchus There was a small pledget of mucus on the distal surface of the flap Unfortunately it was impossible to preserve or photograph the specimen

There was no clubbing of the fingers and no other abnormality was found

It appears that the flap of mucous membrane acted as a partial valve and gave rise to the localized hypertrophic emphysema The bouts of coughing may have been caused by mucus occluding the bronchus completely

A Case of Complete Hypospadias

Cases of complete hypospadias with bilateral undescended testicles are relatively rare The following case history may be of interest from both the anatomical and psychological aspects

Case Record

X Y aged 13 years 9 months was admitted to hospital as a girl patient on January 29 1938 *He* complained of a swelling in the right groin which had been noticed only a few days previously On examination he was found to have a sturdy physique of the male type the shoulder girdle was broader than the pelvic girdle the chest was flat and showed no signs of breast development the muscles were well developed and there was little subcutaneous fat. The distribution of pubic hair was of the male type and he had well marked hirsuties of the face The penis was rudimentary about one inch long, and it had a hooded prepuce The scrotum was completely divided and resembled the labia majora There were no labia minora The urethral orifice was situated just below the base of the penis above a rudimentary vagina which was four inches deep and less than a centimetre in diameter A lump was palpable in the right inguinal canal and a smaller lump could be felt in the left groin

Orchidopexy was carried out by Mr J F Gill on January 31 1938 At the time of operation the right testicle was found lying in the lower end of the inguinal canal it was

of normal size There was an associated hernial sac, which was opened, the pelvic organs were palpated through this opening No uterus or ovaries could be felt On the left side a small testicle was found lying in the lower part of the inguinal canal After freeing the spermatic vessels each testicle was brought down and sutured to the bottom of the corresponding half of the scrotum On April 21, 1938, Mr Gill carried out a one-stage plastic construction of a penile urethra Flaps of mucous membrane were raised on each side of the urethra and sutured over an inserted rubber catheter Healing occurred by primary union

There is no history of a similar condition in any member of the patient's family His parents are of average intelligence, the father is asthmatic, and he has one married sister, aged 25 At birth there was some doubt as to his sex, but it was decided that the child was a girl, and it was brought up as such

He had always been an extremely shy child He had no friends either inside or outside school, and never confided in his parents nor in his sister He liked to play with dolls, and sewed clothes for them He was also fond of cricket and football, and preferred to play with boys His I Q was only 80, and he liked history, domestic subjects, and first aid best There was no sexual history, and no information could be obtained from dreams or fantasies, as he would not relate any of these Leading questions were of no avail He said he preferred to be a girl, since he was brought up as one

Shortly after completion of the operations, however, he asserted himself to an extreme degree He was no longer shy with the other children in the ward (all girls), he played with them, and at times his attitude was overbearing and aggressive In his play he took the role of "mother" and tended to the smaller girls, sometimes kindly, at other times not so kindly He felt a good deal happier, was less introverted, and did not seem to be bewildered at the drastic change in his sexual identity As psychotherapeutic treatment was considered to be a necessary measure to help establish him in his masculine role, he was sent from hospital to a child guidance clinic as an in patient

We are indebted to Mr J F Gill F R C S, consulting surgeon, and to Dr D V Marshall, F R C S Ed, senior medical officer, for their permission to publish this case

Assistant Medical Officers Beverley Road Hospital, Hull

Aneurysm of the Common Iliac Artery

A fatal case of retroperitoneal haemorrhage following rupture of an aneurysm is here recorded, on account of the clinical picture and the rarity of the lesion

CASE RECORD

Clinical History—The patient, a man aged 69 was brought into hospital in a collapsed state; stimulant treatment was given and in about an hour he was able to give a history He had had left sided lumbago for three weeks, and had a left inguinal hernia and a smaller right inguinal hernia, a truss being worn for the former but failing to control it

Examination revealed only a lowered blood pressure, and no cause for collapse Four hours later a large mass was found on the left side of the abdomen, occupying an area similar to that occupied by a spleen reaching the umbilicus The mass was not movable its edges were ill defined, and the posterior limit not detectable it was tender and pulsation of a transmitted type was noted Below this mass, just above the left inguinal ligament lay a second firmer mass giving a direct pulsation this smaller mass was considered by the patient to be a hernia The urine contained albumin but no blood

For ten hours the patient's condition remained unchanged, then he became rapidly worse and died sixteen hours after admission

Post mortem Examination—There were no signs of any external injury The abdomen contained 6 ounces of free blood in the peritoneal cavity A very large retroperitoneal mass occupied the left side of the abdomen, this proved to be a haematoma of the left perirenal space, containing about three to four pints of blood The effusion of blood extended across the mid line to the right kidney region, upwards as far as the diaphragm, into the transverse mesocolon, and downwards into the pelvic cavity The origin of the haemorrhage was found to be a saccular aneurysm the size of a cricket ball, arising from the left common iliac artery The greater part of the wall of the vessel was involved, and the sac was partly filled with laminated blood clot Rupture of the sac had taken place near the origin of the artery from the aorta, and the site of rupture communicated with the haematoma The aorta showed little atheroma in the abdominal part, but some changes in the arch, and there was calcification of the coronaries The left renal artery was normal There was no sign of a left inguinal hernia, and the mass described as a hernia was the aneurysm A small right inguinal hernia was noted The other organs showed no important changes, and no evidence of syphilis was found

Microscopical examination of the wall of the artery near the aneurysm showed advanced atheroma but no evidence of syphilis There was considerable intimal thickening with some calcification, the media remained intact, with no evidence of infiltration Some round celled infiltration of the fatty tissue was noted, and there was a great deal of fibroblastic proliferation in the wall of the aneurysm

COMMENTARY

The case is of interest on account of the unusual site of the aneurysm and the result of its rupture The absence of injury and haematuria excluded the diagnosis of ruptured kidney, which the abdominal findings suggested

A review of the literature of recent years showed two other cases of ruptured aneurysm at this site, both ending fatally, also two cases were found in which the aneurysm had been successfully obliterated by Matas's operation

I am indebted to Dr F E Saxby Willis for his kind suggestions and permission to publish this case, and to Dr E H Creed of King's College Hospital for the microscopical report

Recurrent Ectopic Gestation

The following note of a very unusual case appears to be worth placing on record

A married woman aged 38 was admitted into hospital on July 6 1938 with a provisional diagnosis of ectopic gestation She had eight children, varying in ages from 2½ to 17 years the last two being twins No miscarriages were recorded She became pregnant in 1937 and was operated upon on June 10, 1937, following a seven weeks gestation The left Fallopian tube was found to contain an ectopic pregnancy and was removed The patient menstruated normally following the operation until May, 1938, when the periods ceased

The patient was examined on admission on July 6 and found to have a tender mass in the pouch of Douglas extending to the right Laparotomy on July 7 revealed an ectopic gestation in the right Fallopian tube, which was removed

This case was unusual, first because the tubal pregnancy was repeated inside a period of thirteen months, and secondly because the phenomenon manifested itself after approximately the same period of amenorrhoea

Reviews

POLITICAL ARITHMETIC

Political Arithmetic A Symposium of Population Studies Edited by Lancelot Hogben F R S (Pp 331 illustrated 30s net) London George Allen and Unwin 1938

This volume opens with an introductory essay by Professor Lancelot Hogben, stated (by the publishers) to be a challenging critique of contemporary economics and an eloquent appeal for realistic research on social institutions The first chapter is a study of the decline of fertility in the civilized world by Dr Kuczynski Chapter II contains arithmetical estimates of the future population of Great Britain on different hypotheses and is the work of Dr Enid Charles In chapter III Dr Charles and Dr Moshinsky examine fertility as correlated with locality and occupation In chapter IV Mr Glass studies changes in fertility in the last eighty years Chapter V by Dr Enid Charles is concerned with the structure of the family in Australia and chapter VI by Mr Glass discusses the relation between marriage frequency and economic fluctuations Chapter VII by Dr Kuczynski is a history of opinions on fertility held between 1660 and 1760 Chapter VIII by Mr Gray and Dr Moshinsky studies the distribution of ability and opportunities of education in a large sample of children The same authors in chapter IX relate ability and educational opportunity to parental occupation In chapter X Messrs Glass and Gray examine the working of the scholarship system at Oxford and Cambridge In chapter XI Dr Charles and Mr Morgan investigate the relation between initial and maximum earnings in skilled and unskilled workers The last chapter by Mr Allison Davis is on the distribution of the blood groups and its bearing on the concept of race

The Lord Deputy Strafford is said to have advised anyone about to read a new book on a serious subject to note down what he knew or thought he knew of the subject already At least two of the contributors to this symposium are such well known authors that it must be difficult to carry out Strafford's prescription We think however that a person so unfortunate as never to have heard of any of the present writers and not even very familiar with the voluminous official literature but who has been a reader of the serious weekly reviews during the last twenty five years might think he knew (1) That owing to the decline in the fertility of marriages and the impossibility of an indefinite continuation of improvement in rates of mortality the population must eventually decline (2) That the fertilities of different groups (racial social economic) varied (3) That even if the proportion of clever children in the upper classes were really greater than in the lower classes a great many clever children had poor parents and many of these 'clever' children had insufficient educational opportunities (4) That in unskilled trades one reached one's maximum earning capacity much earlier in life than in skilled trades (5) That race was a difficult concept to define

When the hypothetical reader has perused the new book the addition to his knowledge will be mainly of detail Under each of the above five headings he will find arithmetical evidence some of it covering the whole population some of it covering numerically important samples, and the evidence is clearly set out Those who are bored by tables may be tempted to skip but there is nothing in the exposition to give any reader a valid excuse to skip on the ground that mathematics are beyond him At least one article that by Dr Kuczynski on the opinions of demographers will charm those who are more interested in opinions than arithmetic

It is possible that the style of some of the essays particularly that of the preface may induce the reader who had no other knowledge than he derived from weeklies to underestimate the scientific importance of work done by mere officials or even by private investigators not associated with the Department of Social Biology of the University of London But as scientific justice is seldom done until all parties to a suit are dead this defect, if it be a defect, is not serious

A SURVEY OF BILE

Bile Its Toxicity and Relation to Disease By O H Horrall M D Ph D F A C S (Pp 434 18s net) Chicago University of Chicago Press London Cambridge University Press 1938

With its unusual title and its icteric wrapper this book seems ill designed to attract the casual medical reader This is unfortunate for it contains much information of value to the general physician and abdominal surgeon as well as to the physiologist and pathologist One cannot pretend that the book is easy to read for Dr Horrall like the disappointed professor in Conan Doyle's story appears to have made a life interest of the study of the bile and has collected here all that has been learnt about it since it was advised for use in enemas in an Egyptian sacerdotal papyrus of 1300 B C After discussing the history of his subject Dr Horrall describes the constituents of the bile its origin and fate and the changes it undergoes in the gall bladder If bile is injected intravenously in sufficient dosage death occurs from stupor or with symptoms of cerebral excitation Bile injected subcutaneously causes tissue necrosis and even a large aseptic abscess and a few cubic centimetres of concentrated bile free in the peritoneal cavity cause a transudation of several hundred cubic centimetres of fluid A distinction is drawn between *bile peritonitis* which is caused by the chemical action of bile on the peritoneum and *biliary peritonitis* which is caused by bacteria in the presence of bile in man In man the leakage of bile into the peritoneal cavity causes a very great risk the mortality rate approximating 50 per cent Bile can also cause acute pancreatitis

Although a vast amount of work has been done—this book has a bibliography with over 2 000 references—we still have not really precise knowledge of the mechanism of the depressing effects of jaundice or the toxicity of the bile Nothing other than the bile salts in whole normal bile has been proved toxic the pigments and constituents such as cholesterol and lecithin appear to be harmless Nevertheless whole bile appears to be more toxic than its known constituents Up to the present time there has been no method of determining bile salts accurately in such small quantities as may occur in the blood stream, and indeed it is not certain that they occur in normal blood Dr Horrall concludes that it is the bile salts that are responsible for the toxic action of the bile and that the discoloration caused by the bile pigment—namely jaundice—is a symptom and not a disease a great number of the symptoms that have been attributed to bile are part of a syndrome and not directly attributable to the action of bile itself The toxicity of the bile has been of great importance to

surgeons ever since the development of operations on the biliary system, and the discovery of the therapeutic action of jaundice on rheumatoid arthritis has now made it a practical issue with physicians Dr Horrall's survey is therefore timely, and subsequent workers will owe him a debt of gratitude for it

A KEY TO BIOLOGICAL LITERATURE

Tabulae Biologicae Edited by W Junk, C Oppenheimer, and W Weisbach Volume XIV, Part 4, Volume XV, Parts 1, 2, and 3 (Volume XIV, pp 93, Volume XV, Parts 1, 2, and 3, pp 288, price of one volume, Fl 35, reduced price for subscribers Fl 30) The Hague Dr W Junk 1938

Tabulae Biologicae is an exceptionally valuable work of reference, and it is satisfactory to note that it has established its position firmly, since the volumes are now appearing more frequently, and an editorial leaflet records promises of a large number of new articles in the near future During the last few months Vol XIV has been completed and three-quarters of Vol XV has appeared The fact that two-thirds of this space is occupied by biochemistry indicates the general trend of development of biological science The following are some of the chief subjects the properties of sex hormones of the sterol group (120 pages of tabular matter), the descriptive and physical chemistry of proteins, the biochemistry of wheat, oats, rye, barley, maize, and rice (from the U S S R) A remarkable article by C B Bridges describes the location of Drosophila genes The description of the four chromosomes occupies seven pages of tabular matter No fewer than 150 genes have been located in the second chromosome alone

The outstanding impression derived from perusal of these volumes is the vast amount of detailed information that has been accumulated in the last two decades by biological research Complete new branches of science, such as the physiological actions of sterol compounds, have developed in a few years, and in such cases the reference list is numbered in thousands rather than in hundreds *Tabulae Biologicae* provides an extremely convenient means for obtaining summarized information regarding important new developments, and the value of the publication is bound to increase as the mass of biological literature becomes more and more unmanageable

MALARIA AND ANKYLOSTOMIASIS IN PREGNANCY

Malaria and Ankylostomiasis in the Pregnant Woman By G A W Wickramasuriya, F R C P Ed F R C S Ed M C O G (Pp 179 11 illustrations, 9 tables 10s 6d net) London Humphrey Milford, Oxford University Press 1937

This is one of the two jointly awarded Katherine Bishop Harman Prize Essays of 1936 prepared for publication in book form The book represents experience gained by the author in Ceylon, more particularly at the De Soysa Lying-in Home during the period of the epidemic, which provided unrivalled opportunities for continuous and detailed observation on a large number of women suffering from malaria of various types and varying degrees of severity Among important effects produced by malaria in the pregnant woman are anaemia, 10-15 per cent haemoglobin values being not uncommon, oedema of renal or in some cases of nutritional type, albuminuria, seen in 50 per cent of the 357 puerperal women in the author's series, and low blood pressure occurring especially in pernicious forms of malaria In the author's experience pernicious manifestations of various kinds are more frequent in pregnancy than in the non-pregnant state, and the resemblance of some of the symptoms to eclampsia may make diagnosis very difficult Further, malaria definitely increases the tendency to eclampsia, pre-eclampsia, and "nephritic" toxaemia The suddenness with which pernicious symptoms may supervene and the danger of too early relaxation in treatment with the reappearance of coma, etc, is emphasized by Dr Wickramasuriya Spontaneous termination of pregnancy before term and death of the foetus are common effects Infection of the foetus was present in three out of six cases of foetal death but death may result without this—for example, from placental infection alone Hookworm infection is a common cause of maternal and foetal mortality in the Island An investigation made to ascertain the cause of foetal death in 648 consecutive cases of stillbirth showed that ankylostomiasis accounted for 3·4 3 per cent

The work is a useful treatise on the subject of malaria and ankylostomiasis in pregnancy, backed by considerable practical experience, and should be very helpful to the practitioner who may have to deal with pregnancy in the Tropics It contains little of interest to the parasitologist

THE SCIENCE OF NUTRITION

Textbook of Nutrition By J A Nixon, M D, F R C P, and Doreen G C Nixon M B B S, M R C S, L R C P (Pp 219, 9 figures 7s 6d net) London Humphrey Milford, Oxford University Press 1938

For some time past the interests and publications of Dr J A Nixon, until recently Professor of Medicine in the University of Bristol, have dealt largely with dietetics and the science of nutrition, so that his *Textbook of Nutrition* compiled with the help of his wife, may be expected to present the facts in an accurate and ordered manner It may be said at once that the book gives an admirable survey of the subject, and will appeal not only to medical men and to biochemists, but also to students of domestic economy and to laymen who require guidance in the problems of feeding children and adults and different classes of the population After a rapid review of the physiology of digestion and absorption of food stuffs, the requirements of the body at different ages are dealt with For public health purposes not only anthropometrical methods but clinical observations are needed to assess the physiological efficiency and to detect early deficiency The authors rightly point out that beyond the ordinary quantitative and balanced food requirements in proteins, fats, carbohydrates, and vitamins, individual absorptive capacity must be considered In some communities the question of availability of foods is a factor of importance, in ours the economic question is outstanding, apparently all except a relatively small fraction of the population are obtaining the full amount of calories they require, but there may be relative shortage of fats proteins, milk, fruit, and vegetables in some classes On the other hand, the deficiency may not be due to poverty or ignorance but sometimes to carelessness or indifference Instruction in housekeeping and methods of cooking must be combined with production of cheaper food or higher incomes It would appear, however, that the standards of food requirements have not yet been finally determined

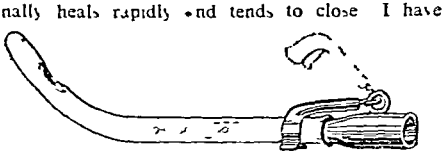
Chapter VIII, which occupies one quarter of the book, opens with a discussion of the principles underlying the choice of foods in ordering diet, and then gives tables of the food content and constituents of fruits, vegetables, cereals, various sweets, fish, meat, poultry, game, and animal organs These are based on recently published analyses and are useful and accurate A minor discrep-

ance is that the fat content of an egg is given as 4·0 grammes on page 116 and 6·0 grammes on p 105 this depends on the size of the egg but the latter figure is the one usually taken The chemists are not yet satisfied however and these tables though generally accurate may be superseded in detail especially if portions as served at table are considered Again uniformity is difficult to obtain unless one standard of cooking is used In the case of the vitamins already there has appeared in *Nutrition Abstracts and Reviews* April 1938 an excellent series of revised tables of vitamin content of foods which was probably not available to the authors at the time of going to press Besides these tables are rather frightening to practitioners unless they are trained in the details of dietetics The authors thus recognizing that these food tables must not be regarded as possessing the reliability of *Bradshaw's Railway Guide* counsel a rougher reckoning which will often give equally good results and include as well as an abbreviated table of the principal foods a series of menus which may be used in drawing up an ordinary diet The relations of diet to disease prevention and to disease production and infections are important aspects of the science of nutrition which are dealt with in an interesting and satisfactory way and the final chapter on nutrition in disease supplies the principles of diet in fevers anaemia diabetes renal disease and lactation The authors have produced a good book which should have a deservedly wide class of reader

Notes on Books

Written with charm and clarity and recalling some of Arthur Hugh Clough's shorter verses Dr W P S BRANSON'S scholarly thirty eight *Sober Pieces and Songs* (Cambridge printed for the author at the University Press) have a musical meditative and sometimes melancholy touch which attracts without depressing The first item will be familiar to many old Bart's men who admired it as an anonymous poem in the *St Bartholomew's Hospital Journal* more than thirty years ago The printing and style of production form a most suitable setting Inquiries for this book may be addressed to the Printer Mr Walter Lewis at the University Press, Cambridge Price 5s

The fifth volume of the *Animal Year Book* published by ULAWS (The University of London Animal Welfare Society, 2s 6d) contains several articles of exceptional interest Sir Peter Chalmers Mitchell writes on game reserves and national parks Discussing the possibility of their establishment in Great Britain he mentions that in a recent departmental committee under the chairmanship of Dr Addison (now Lord Addison) proposals were considered which envisaged the acquisition of some such region as Snowdonia Cannock Chase or part of the Scottish Highlands for this purpose Sir Peter points out that should this happy eventuality materialize it would be equitable to make concessions in the shape of rest houses for walkers car parking places and roads of access to the large proportion of the public which is not keenly interested in natural history Within the precincts of a large national park smaller and more securely protected sanctuaries could readily be established Other instructive and interesting articles deal with the whaling and sealing industries while Dr Brook writing on tuberculosis in cattle and its control makes it clear that improved conditions and humane treatment of farm animals will go a long way towards providing uninfected milk Following nearly thirty pages of book reviews is an appendix devoted to the current activities of ULAWS which persistently continues its advocacy of cyanide fumigation for rabbit control and its humane campaign against the use of the gin trap Although membership of the society is mainly confined to those associated with the University of London all members of the public who subscribe ten shillings or more are eligible as Fellows ULAWS certainly deserves wide financial support



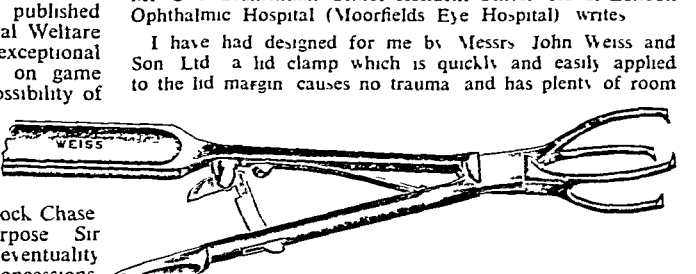
Dr PAUL SCHILDER has written much on medical psychology and his experience in the Bellevue Hospital of New York compels respect for his contribution *Psychotherapy* (Kegan Paul Trench Trubner and Company 10s) He definitely bases his method and theory on Freud's teaching but does not feel bound by all the modifications of the psycho analytic schools The present book seeks to set out the general principles for medical psychological treatment and gives several clinical illustrations which elucidate the argument Many similar books have been written with almost identical contents in the last few years and while this is a good example there is no reason to regard it as in any way outstanding

Preparations and Appliances

ANTRUM CATHETER

Mr C HAMBLEN THOMAS F R C S (London W 1) writes

Following an intranasal antrostomy the opening made occasionally heals rapidly and tends to close I have had



prepared for me a rubber catheter which I slip over a thin antrum cannula and put on the stretch with the attached clip I insert this into the antrum remove the clip and withdraw the cannula The rubber catheter expands stretches the opening and remains in position The instrument is made for me by Messrs John Bell and Croyden Wigmore Street London W 1

CLAMP FOR TARSORRHAPHY AND PLASTIC OPERATIONS ON THE LIDS

Mr C J Blumenthal Senior Resident Officer Royal London Ophthalmic Hospital (Moorfields Eye Hospital) writes

I have had designed for me by Messrs John Weiss and Son Ltd a lid clamp which is quickly and easily applied to the lid margin causes no trauma and has plenty of room

between its limbs for the removal of the posterior lip of the lid margin The handle and catch are the same as in a standard needle holder while the two pairs of teeth are set on four slender curved limbs the two pairs fifteen millimetres apart

The instrument finds a use also in operations on the upper lid where double eversion is necessary and does away with the necessity of retaining sutures

My thanks are due to the honorary surgeons at Moorfields who tried out the instrument and allowed me to use it on their cases

directly on the gonococcus and will kill it *in vitro* in comparatively low concentrations, they appear to produce bacteriostasis, which goes on to bacteriolysis in favourable cases, some patients seem to conjugate the drug in their tissues less efficiently than others, which may be an explanation of some of the failures With a few notable exceptions all those who have had experience are agreed that we now have a very potent remedy for gonorrhoea, but much more experience is necessary before the optimum dosage, the best time to begin treatment, and the general management of a case will be agreed, some give concomitant irrigations, others prefer to omit these In any case it cannot be too strongly stressed that very great care should be exercised in employing the sulphonamides, and still more care in testing for cure, since a considerable proportion of cases relapse and the mere cessation of discharge may lull the patient into a false feeling of security with disastrous results to himself and to others Urethroscopic, prostatic, microscopical, cultural, and serological examinations should be carried out on a number of occasions with negative results before a patient is pronounced cured

SOCIAL SERVICE

There is probably no one better able than Mr J Q Henriques to write *A Citizen's Guide to Social Service*[1] He has a very wide and practical acquaintance with his many-sided subject, he can expound it in a clear, agreeable, and effective style and manner, and his theme is consistently maintained This theme is, broadly, the place and value of voluntary effort in relation to the social services —housing, health, unemployment, public relief, and now occupation and community centres for the use of leisure—established by or under the auspices of central Government departments and local authorities It is very important just now that this theme should be set out and developed, for, though a differing emphasis may be placed upon voluntary activities in this connexion by different schools of thought, nearly all will agree that they have an important, even essential, place, and yet the knowledge of the increasing provision of services publicly organized and financed tends to slacken the effort of voluntary agencies and to limit the number of their unpaid available personnel This timely task of defining and reviewing the relative spheres of voluntary effort and of public social provision is very well done by Mr Henriques He sets out the nature, extent, and advantages of the several public services quite fully and fairly Their effectiveness within their particular statutory fields, especially the strength they derive from communal organization and public financial support, is not questioned, but it is claimed that they suffer from definite disadvantages from which voluntary agencies are free, and that they tend to produce in their beneficiaries an undue and unwholesome dependence and loss of self-reliance which is not manifested when help is given under voluntary auspices On these two propositions the author's arguments are not equally cogent Most people will agree with his conclusions as to the former, but many will not be satisfied that he has demonstrated the latter beyond all doubt

The point of view of the constructive social voluntary worker is contrasted both with that of the public administrator and with that of the indiscriminate almsgiver The charitable impulses of the last group are quite uncontrolled, and their gifts are dispensed without any real justification Yet no individual can properly be treated as a self-contained unit, he has needs and difficulties which are related to his own environment and to the general community It is one of the prime functions of the voluntary worker to discover and to consider these On the other hand, the public administrator as such is governed and limited by Acts of Parliament and regulations, rules, and orders which curb his executive authority and action and render him liable to public criticism both from those who think he has gone too far and from those who think he has not gone far enough He cannot ignore these conditions, and must always tend to consider the clientele of the service he is administering as in the mass or on the average For him experiments and the making of individual exceptions are impossible or dangerous These, however, are not only open to the voluntary social worker but should be his business, and his task—often a hard one—is to adjust his own point of view not so much to public opinion (whether expressed by a Government department, a local committee, or otherwise) as to that of the person who has applied for help It is manifest that there is a field in which the voluntary worker alone can safely and successfully act, and it must be clear also that he can be of very great assistance to the public administrator or authority in the detailed work of their departments The need and the means for such co-operation are adequately dealt with by Mr Henriques

Sir Wyndham Deedes writes in a foreword to the book "Not everyone will agree with all of it, I do not" Such disagreement may very likely be felt with regard to that other of the author's main propositions mentioned above It is not obvious that dependence on voluntary help is necessarily less demoralizing than dependence on public assistance

[1] London George Allen and Unwin, Ltd (10s 6d)

statutorily provided That such is the case is assumed rather than demonstrated by Mr Henriques and this seriously weakens a considerable part of his case Every individual needs help in some form from time to time, and it is the privilege of all at times to give it This should not lead to any loss of pride in independence but if it be true that either voluntary or statutory provision does in fact undermine self respect in an appreciable number of cases it is a disquieting symptom Mr Henriques believes that this is so and his opinion must carry great weight even though his suggested remedy may not be a complete cure

VASOMOTOR CONTROL OF THE CEREBRAL CIRCULATION

Until recently it was generally believed that the cerebral vessels were exempt from the constant control exerted by the autonomic nervous system on the other systemic vessels The persistence of this belief is an interesting example of that undue reliance on physiological demonstrations rather than on morphological facts which has hindered the progress of sympathetic surgery for histological proof of the existence of a nervous network in relation to the cerebral vessels was provided by Gulland[1] and also by Huber[2] at the end of the last century In view of recent attempts to control the factor of vasospasm by surgical means —sympathectomy for disseminated sclerosis has been described in a recent issue of this *Journal* by Koch and de Savitsch and the results of infiltration of the stellate ganglion in selected cases of apoplexy by Mackey and Scott[3]—the complete summary by Schneider[4] of the anatomical and physiological evidence in favour of vasomotor control of the cerebral circulation is of special interest A large amount of anatomical evidence has accumulated during the last ten years Von Stohr[5] in 1928 described the detailed arrangement of the nervous plexus surrounding the vessels of the pia mater and the choroid plexus Clarke[6] in 1929 demonstrated a perivascular network on the vessels of the medulla oblongata and the medulla spinalis Penfield[7] could show the method of termination of nerves on the vessel wall Three methods of physiological examination have been employed to demonstrate the existence of vasomotor nerves direct inspection of the vessels through an airtight glass window fitted in the skull by Forbes[8] in 1928 observations on the flow through the intact carotid artery with the *Stromuhr* by Rein[10] in 1930 perfusion studies on the completely isolated head by Bouckaert and Jourdan in 1936[11] Direct inspection of the cerebral vessels during electrical stimulation of the cervical sympathetic shows a vasoconstriction and section of the sympathetic trunk produces a distinct dilatation extending into the capillary bed Measurements with the *Thermostromuhr* show quite plainly that stimulation of the cervical sympathetic diminishes the circulation through the internal carotid artery and that sympathetic section is followed by an increased flow Experiments with the isolated and perfused head demonstrated clearly that vasoconstriction invariably follows sympathetic stimulation and of course in these experiments any possibility that the constriction might be secondary to vascular changes elsewhere was quite excluded Much work has also been done on the complex relationships which undoubtedly exist between the sensitive region of the carotid sinus and the cerebral circulation but even neglecting this and other complicated aspects of the problem it seems clear that so far as the cerebral vessels are concerned the Monro doctrine of 1783 may now be abandoned Indeed when the very special needs of the cerebral circulation are considered—it has been calculated that 1 000 c cm of blood must circulate per minute to maintain proper oxygenation—and when it is remembered that the nerve cell is the most sensitive of all bodily structures to ischaemia the idea that the cerebral circulation should play a passive part without means of local compensation for any accident which might affect the systemic circulation as a whole is patently absurd

THE NATURE OF VIRUSES

The last ten years have seen a considerable advance in our knowledge of viruses We can now measure them with a fair degree of accuracy and many have been stained and seen with the microscope Means have been devised for isolating them in relative purity and considerable amount many have been cultivated outside the animal body and we know how to preserve them without loss of potency for long periods of time A study of virus immunity has shown that the mechanism of this immunity possesses fundamental similarities with that of bacterial immunity one or two viruses have even been shown to possess an antigenic complexity comparable with that of bacteria Yet with all this knowledge it is still not possible to pronounce with certainty on the nature of these agents Despite the fact that the solution of this question is not material to the study of most virus problems it is of such abiding interest that virus workers continue to search for the answer One of the difficulties in the way of deciding whether viruses are living microorganisms or unorganized chemical auto-catalysts is our inability to define with certainty what we mean by life It is recognized of course that living things exhibit certain properties such as ability to multiply with retention of individuality and the power to adapt themselves to changes in environment all these are possessed by viruses But as Sir Gowland Hopkins has recently pointed out it is possession of an inde

directly on the gonococcus and will kill it *in vitro* in comparatively low concentrations, they appear to produce bacteriostasis, which goes on to bacteriolysis in favourable cases, some patients seem to conjugate the drug in their tissues less efficiently than others, which may be an explanation of some of the failures With a few notable exceptions all those who have had experience are agreed that we now have a very potent remedy for gonorrhoea, but much more experience is necessary before the optimum dosage, the best time to begin treatment, and the general management of a case will [illegible] agreed, some give concomitant irrigations [illegible] prefer to omit these In any case it can[illegible] strongly stressed that very great care [illegible] exercised in employing the sulphona[illegible] more care in testing for cure, sin[illegible] proportion of cases relapse an[illegible] of discharge may lull the pa[illegible] of security with disastro[illegible] to others Urethrosc[illegible] cultural, and sero[illegible] carried out on a[illegible] results before [illegible]

[illegible] Sir Patrick Laidlaw is [illegible] for he believes that all [illegible] of the same nature And in an [illegible] the apparent conflict in the avail[illegible] he has put forward an hypothesis which [illegible] to reconcile it He points out that there [illegible] evidence to show that parasites lose the power [illegible] making substances essential to them which are to [illegible] found ready made in the cells of their hosts, and he suggests that in the case of parasitic micro-organisms this "fitness" might be pushed to such an extreme that eventually all independent metabolic activity would be lost The parasite would then be living a borrowed life, as Sir Patrick Laidlaw puts it, and would consist merely of specific nucleo protein possessing the power of reproduction outside the susceptible cell it would appear inanimate Is it not possible, Sir Patrick Laidlaw asks, that viruses are micro-organisms committed to an intracellular mode of life which have traversed the road to parasitism to varying degree? The large viruses would thus be those which had lost the ability of synthesizing one or two factors essential to their growth, whilst at the other end of the scale would be those viruses which had lost all auto-synthetic power and possessed only the ability of transmitting the characters of the species, such as the crystallizable plant viruses and possibly the very small animal viruses Between these two extremes would be viruses which had achieved specialization in parasitism to varying degrees progressive loss of enzyme activity being attended with a corresponding decrease in size The view that viruses are micro-organisms degraded through parasitism is not new, but Sir Patrick Laidlaw's hypothesis gives an explanation which embraces all viruses and links them up with free living micro-organisms Whether he is right or not time will show In the meantime he has especially the strength they derive from com[illegible]e organization and public financial supp[illegible]ing field questioned, but it is claimed that [illegible] definite disadvantages from [illegible] agencies are free, and th[illegible] in their beneficiaries [illegible] dependence and [illegible] manifested [illegible] auspices [illegible] argu[illegible]

VITAMIN E

[illegible] nical nature of vitamin E has [illegible] by the lack of an even approx[illegible] [illegible] method of determining the potency [illegible] al material free of the various fractions [illegible] separated from it It is known that in the [illegible] of vitamin E in the diet of rats an implanted [illegible] may still develop for a short time, but that [illegible] sorption occurs and no young are born The condition can be cured by giving adequate doses of wheat germ, wheat-germ oil or concentrates, or other sources of vitamin E In the male rat degeneration of the testes results from the deprivation of vitamin E, and no regeneration of the affected parts can take place, so that if the degeneration is complete the male rat remains sterile for the rest of his life Mason[1] has suggested that "vitamin E plays some very essential role in nuclear activities, being necessary either for maintenance of the normal physico-chemical structure of nuclear chromatin or for some metabolic process or processes concerned with the synthesis of the complex chromatin molecule" Recent work by Bacharach[2] seems to show that vitamin E deficiency leads to a failure even in implantation of fertilized ova Barrie[3] has discovered degenerative changes in the anterior pituitary and hypoplasia of the thyroid The latter observation had also been made by Singer[4] Barrie[3] has also recorded cretinism in young rats born of mothers receiving suboptimal quantities of vitamin E Evans and Burr[5] and later Burr *et al*[6] found a paresis in rats fed on a vitamin-E-deficient diet, and could not cure it, though they could prevent it by giving vitamin E Neither deficiency nor excess of vitamin E has been found to have any influence on experimental or spontaneous sarcomata or carcinomata It is considered "not proven" that vitamin E has any influence on the growth of young rats It may easily be understood how very difficult it would be to use any of these effects of vitamin-E deficiency as criteria for the measurement of vitamin E The best attempt to make measurable an effect of vitamin-E therapy has been made by Bacharach,[8] who has constructed a curve of response relating dosage and response to vitamin E in rats By its use he can make comparisons between different substances, and when a standard of reference becomes available he will be able to express the potency of a substance in terms of the unit of activity adopted In the meantime[9] he has used it to compare the potencies of α- and β-tocopherol and found the mean fertility doses (that is the doses that will cause 50 per cent of implanted animals to bear live litters) to be

1·2 mg and 1·9 mg respectively A standard of reference may however be adopted in the not too distant future for in spite of all the difficulties attendant in following the fractionation of concentrates it really appears probable that pure vitamin E will shortly be available Many workers[1] as usual have contributed to this discovery and after separating and identifying various inactive compounds it has been accepted that both α and β tocopherol have vitamin E activity though the amount of these separated from wheat germ oil does not account for more than about 5 per cent of the oil's activity The synthesis of tocopherol[2] by different workers seems to indicate that the structure proposed by Fernholz is the correct one—namely that the vitamin has a chroman rather than a coumaran structure with two substituents in the 2-position Evidence of the successful clinical use of vitamin E in cases of habitual abortion is slowly accumulating[3] and Shute[4] suggests that vitamin E and oestrin or a substance much like it exist in a sort of equilibrium during pregnancy If there is too much of the oestrin-like substance the pregnancy is interrupted It is safe to prophesy that when pure vitamin E becomes available clinical trials will make rapid progress

DIAGNOSIS OF SYPHILIS

A pamphlet issued by the U S Public Health Service Washington *The Diagnosis of Syphilis by the General Practitioner* should have a big vogue in America and a not inconsiderable one in this country It is often said that the average general practitioner seldom diagnoses syphilis The reasons for this are three according to Dr J Earle Moore (1) that he does not expect to meet it (2) that he does not realize its prevalence and (3) that very often he does not recognize it when he meets it The essence of this little book lies in thirty figures in which are set out clearly and succinctly diagnostic maxims in early late and latent syphilis and lists of other conditions which may closely simulate each of these The moral to be drawn from it is that in any condition which could possibly be syphilitic or in which the diagnosis is not clear if there is an early surface lesion it should be examined by the dark ground for spirochaetes and in any case the patient's blood should be submitted to Wassermann and flocculation tests Serum tests have a specificity of nearly 100 per cent and a sensitivity of about 80 per cent in untreated cases and are often the only possible means of diagnosing the disease moreover under the venereal diseases scheme in this country they can be carried out free of cost There is no doubt that large numbers of cases of syphilis go undetected simply because a routine blood test is not carried out on every patient who goes to hospital if every pregnant woman had her blood examined congenital syphilis would soon become a thing of the past

RADIOTHERAPY OF CARCINOMA OF THE CERVIX

The second Annual Report on the results of radiotherapy in cancer of the uterine cervix has just been issued by the Health Organization of the League of Nations under the editorship of Professor Heyman As the first report[1] dealt with the results obtained in cases treated in 1930 so this report is concerned with treatments carried out in 1931 Three additional contributors are announced since the publication of the first report Dr Laborde of the Institut du Cancer Paris Dr Healy of the Memorial Hospital New York and Dr Ward of the Women's Hospital in the State of New York During the past year the committee has devoted its attention mainly to the means of securing greater uniformity in the allocation of cervical cancers to their respective grades and to simplification and explanation of the system of grading In order to facilitate the preparation of these records there has been published since the issue of the first report an atlas prepared by Dr Heyman in collaboration with Dr Strandquist the latter of whom has furnished a series of excellent practical diagrams which cannot fail to be of service in classifying the different cases This volume also embodies some modifications in the various definitions and explains certain difficulties which may arise in classification No attention has been given to the varying methods of radiotherapeutic technique used at the different clinics as it is not yet considered practicable to assign differences in cure rates[2] to variations in procedure and the committee feels that it would be inadvisable to attempt any such differentiation at present The reason for this is the existence of other variable circumstances which may affect survival rates quite apart from considerations of the different methods of treatment employed The elimination of these variables is the primary object of the committee at the present time The main body of the report consists of statistical tables giving the results obtained at the collaborating institutions arranged upon a uniform and standardized plan The value of early diagnosis and treatment is again demonstrated but unfortunately the tendency to delay in seeking advice and treatment at the earliest possible moment is only

1 Reviewed in the *British Medical Journal* 1937 2 755
2 Reviewed in the *British Medical Journal* 1935 1 1064

too manifest Of 5,672* patients treated, 1,491 were alive and free from recurrence five years after treatment, while 3,901 died of cancer The reasons for this heavy mortality are abundantly clear from the following table

Results of Treatment Calculated for Each of the Four Stages

	Number of Patients Treated	Alive Without Recurrence	Relative Cure
Stage I	607	335	55 2%
Stage II	1 626	590	36 8%
Stage III	2 417	512	21 2%
Stage IV	1 020	54	5 3%
Unclassified	2	0	0 0%
Totals	5 672	1 491	26 3%

Only about 10 per cent of the patients presented themselves for treatment in the earliest stage, while over 89 per cent were in later and less curable grades To a large extent this is undoubtedly due to reluctance on the part of the patient to submit to proper examination and to fear as to its diagnostic results Again, there is the optimistic note of the earliest symptoms "not being of much consequence," coupled with the hope—one might almost say expectation—that the trouble will right itself soon So much must be admitted, but the fault is not always on the patient's side Frequently patients present themselves at the clinic, having been under "treatment" for some considerable time, but no examination has been made The fact is that as cancer is a very common disease routine and systematic instruction in early signs and symptoms should form part of the education of every medical student Without this it is impossible for any real progress to be achieved, and it is gratifying to note that in New York systematic courses of instruction in neoplastic diseases form an integral part of the curriculum in certain of the university courses The work of the American College of Surgeons in furthering the provision of such educational facilities is an enormous step forward and we should like to see systematic instruction in these diseases placed in a similar position to instruction in infectious diseases by compulsory attendance at special cancer institutes in this country

* This includes *all* cases reported to the committee including some treated as long ago as 1914

ACUTE LARYNGOTRACHEOBRONCHITIS

Under this heading J Brennemann and colleagues[1] in Chicago have recently discussed a comparatively rare but terrifying malady in young children The onset may be sudden or may appear to follow an ordinary upper respiratory tract infection The child is usually in the first two years of life, and by the time medical aid is sought the picture is that of a severe infection of the upper respiratory tract with laryngeal and obstructive expiration as outstanding features The child looks up with free hy the temperature is between 102° and right or not time w spirations are rapid and laboured there is inspiratory stridor and hoarseness, with deep retraction of the suprasternal notch, of the supra clavicular spaces, of the substernal region and, in infants, even of the sides of the thorax An inflamed throat is found on examination, auscultation of the chest reveals a short inspiratory stridor and nearly always an expiratory wheeze, together with coarse rales all over the chest Areas of collapse of the lung appear with startling rapidity, and in fatal cases broncho pneumonia commonly ends the picture Indeed the clinical description would almost fit the suffocating type of bronchopneumonia with evidence of bronchial spasm that is occasionally seen The evidence of bronchoscopy, however and the favourable outcome in energetically treated cases indicate that the lung parenchyma is not involved The idea of bronchoscopy in small children with such an intense inflammation of the respiratory passages may appear revolutionary, but, as Brennemann points out, before the use of this method of treatment the results were unsatisfactory When he and his co-workers "let Nature take her course aided only by steam inhalations and our prayers" the mortality was in the region of 50 per cent The later results with co-operative team-work involving the services of a bronchoscopist reduced this to 25 per cent The bronchoscopic picture is that of an intense inflam mation of the mucosal lining, with thickening of the membrane and obstruction of the airway in the larynx and in the smaller bronchi Associated with this is the formation of large quantities of thick, tenacious secre tion, frequently becoming dry, adherent, crust-like, and causing obstruction of the airways, including the bronchi The treatment now adopted is to admit the child at once to a room at 75° F saturated with vapour In all serious cases direct laryngoscopic and broncho scopic examination and bronchoscopic aspiration are carried out These procedures exclude the possibility of laryngeal or tracheal diphtheria and give immediate relief If the severity of the condition warrants it, a low tracheotomy is done at once with the bronchoscope in position The child is then disturbed as little as possible and abundance of fluid administered—by mouth, if possible or by other routes Any return of the obstructive symptoms calls for prompt expiration through the tracheotomy tube by means of a catheter and a suction pump Blockage of a bronchus may be indicated by sudden changes in the child's condition and especially by displacement of the heart, and calls for further bronchoscopic aspiration Drugs appear to play no part in the treatment of the condition exception being made in favour of sulphanilamide if cultures of aspirated material show the haemolytic streptococcus The course of the illness is many days or even weeks, marked by exacerbations and set-backs occasioned by the recurrence of obstruction of a serious degree Gradually the exudate becomes more liquid and the difficult phase of getting rid of the tracheotomy tube has then to be faced Tabulated reports from other centres show that the pre-bronchoscopic mortality of 50 per cent is general, and the measures successfully adopted to halve this in Chicago will be studied with interest by paediatricians and oto laryngologists

SURGICAL PROCEDURES IN GENERAL PRACTICE

This is one of a series of articles contributed by invitation

FRACTURE OF THE CARPAL SCAPHOID

BY

H. A. BRITTAIN, M.Ch., F.R.C.S.

Fracture of the scaphoid bone is by far the most common injury of the carpal bones and is also easily the most neglected fracture in the body. It is caused by a fall on the outstretched hand and is sometimes associated with a Colles's fracture. Fractures of the scaphoid bone are classified into three groups: (1) fractures of the waist, (2) fractures of the tuberosity, (3) polar fractures—these are chip fractures of either extremity.

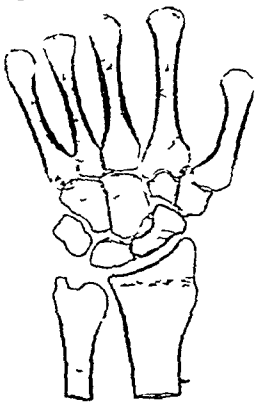

FIG. 1

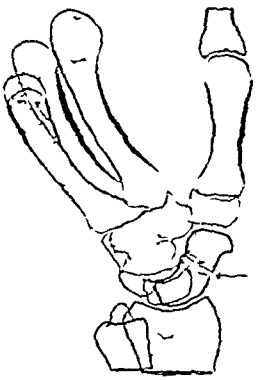

FIG. 2

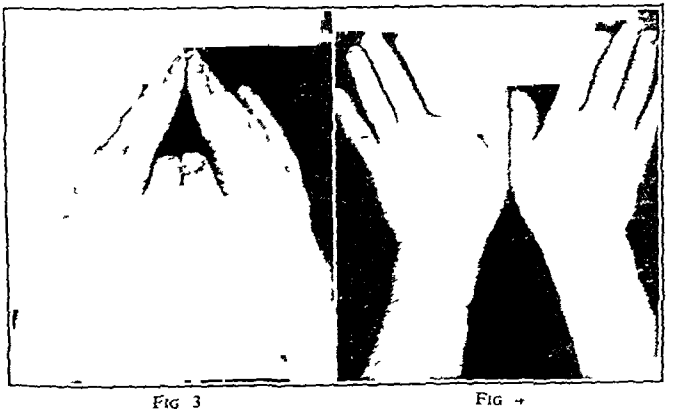
FIG. 1.—Antero-posterior view. Scaphoid appears intact.
FIG. 2.—Oblique view. Line of fracture of scaphoid evident.

The clinical signs are tenderness over the scaphoid bone, particularly in the anatomical snuff box, which may be obliterated by swelling or deformity. Limitation of the movements of the wrist joint, particularly of dorsiflexion, and weakness of the grip.

X-ray photographs should be taken in three planes. In the antero-posterior view the long axis of the bone is directed towards the plate, and as a result the fracture may not be shown. An oblique view of the wrist will reveal the fracture (Figs. 1 and 2) as here the plate is held parallel to the long axis of the bone. It will be seen therefore how important it is to take an x-ray photograph of the oblique view as well as of the antero-posterior and lateral views as a routine in all injuries of the wrist joint (Figs. 3 and 4). It is sometimes difficult to detect a recent fracture in an x-ray film, but the crack becomes more obvious after the first three weeks.



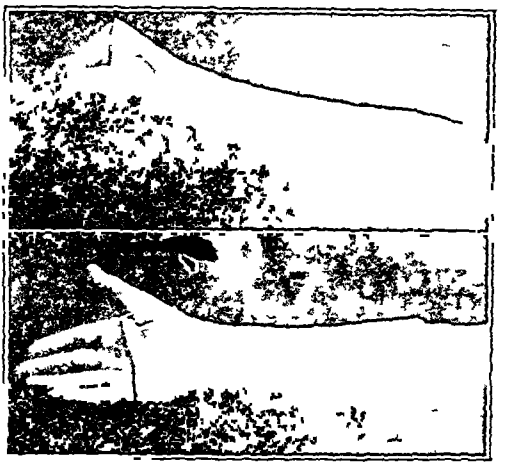


FIG. 3

FIG. 4

FIG. 3.—Position of hands for taking oblique x-ray photograph of the wrist.
FIG. 4.—Position of hands for taking antero-posterior x-ray photograph of the wrist.

FIGS. 5 and 6.—Showing complete plaster for fracture of scaphoid.

Differential Diagnosis

A simple sprain of the wrist may simulate a fractured scaphoid. It consists of tearing of the ligaments of the wrist joint, generally the dorsal ligaments. There is usually an effusion into the joint and limitation of movements, but tenderness is not limited to the scaphoid and the x-ray photographs are negative.

Treatment of Recent Fractures

This consists of immobilization of the wrist in plaster of Paris in a position of slight dorsiflexion and ulnar adduction until union has taken place. There is rarely displacement unless there has been a dislocation of the wrist joint or of other carpal bones, so that reduction is usually unnecessary.

Two forms of splintage may be used. They are the dorsal strip, the complete plaster (Figs. 5 and 6).

THE DORSAL STRIP

This consists of from twelve to sixteen layers of plaster-of-Paris bandage from five to six inches wide. It is first made on a table with a wet plaster bandage and is applied over a layer of stockinet, a small aperture being cut in the latter for the thumb. It should extend from the heads of the metacarpals to the elbow joint, but should be trimmed so that its upper extremity does not impinge

against the biceps tendon when the elbow is flexed The strip is bandaged on smoothly with a wet lint or domette bandage three inches wide After the plaster has set the bandage may be removed and a dry one substituted, but this is not essential The ends of the plaster are smoothed down by turning back the stockinet The hand is secured to the plaster by three strips of strapping, half an inch wide by eight inches long, which pass from the strip over the dorsum of the wrist across the palm of the hand and back again to the strip These can be reinforced by further pieces of strapping if considered necessary

THE COMPLETE PLASTER

Unless constant supervision is available this is to be preferred to the dorsal strip If the strapping is not frequently readjusted it will tend to slip, with resultant inadequate immobilization and possibly non-union To make the complete plaster the dorsal strip is reinforced by an anterior strip three inches in width which is extended on to the palm The palmar limit allows 90 degrees of flexion at the metacarpo-phalangeal joints The proximal limit is the same as for the dorsal strip It is maintained in position by a carefully applied circular plaster-of-Paris bandage A bandage one inch in width is applied around the palm between the thumb and the index finger

BONY UNION

Firm bony union cannot be expected to take place under eight weeks, with the exception of fractures of the tuberosity, which, being extra-articular, unite more rapidly At the end of this time the plaster is removed and the wrist radiographed If union has taken place bony trabeculae will be seen growing across the fracture line It may be necessary to use a lens to determine this with certainty A clinical sign that union has taken place is the return of strength of the grip Before union has occurred firm approximation of the tip of the index finger to the thumb will cause pain even when the plaster is applied This pain disappears after union If this sign is present at the end of two months it is wise to maintain the plaster for another month If after removal of the plaster both the clinical and x-ray signs indicate that the fracture has not united the plaster should be reapplied for another two months If union has not taken place in six months operative procedures such as bone-drilling or bone grafting should be considered From the beginning of treatment active movements of the fingers must be encouraged and, if necessary, supervised by a massage department The patient should also be encouraged to carry out his work as far as possible The function of massage in all injuries of the wrist-joint is to preserve the mobility of the fingers, elbow, and shoulder Full flexion at the metacarpo-phalangeal joints is 90 degrees, at the proximal interphalangeal joints 80 degrees, and at the distal interphalangeal joints 100 degrees Massage of the wrist-joint itself will rarely be essential, but should be given when progress is slow

Manipulation—After the immobilization necessary to get union, particularly if it has been necessary to maintain the plaster cast longer than usual, the wrist may be left stiffer than normal, with restriction of movement and consequent pain Usually time and active movements suffice to mobilize the joint Manipulation should not be attempted while improvement is occurring, but it should be considered when the joint has limitation of movement and is painful three months after the plaster has been removed and the radiograph is normal It can be performed under nitrous oxide anaesthesia and consists in putting the joint through a complete range of movement, at the same time exerting traction The hand should also be rocked laterally and antero-posteriorly on the radius and ulna Further treatment consists of heat, massage, and active movements

Treatment of Sprain of the Wrist-joint

The wrist should be immobilized by a dorsal strip for from one to three weeks, followed by physical treatment If symptoms persist another x-ray photograph should be taken to make certain that a fracture of the scaphoid is not present

Old Fractures of the Scaphoid

Non-union is due to inadequate immobilization In any event union of the fractured scaphoid is slow because the bone is mainly intra-articular and its blood supply is poor In fractures of the waist the vessels have to grow from the distal into the proximal fragment Established non-union is diagnosed clinically by weakness of the grip and pain over the scaphoid, and radiologically by widening of the fracture-line, even to cavity formation There is a marked discrepancy in the texture of the fragments, the proximal fragment becoming much denser

Treatment of Non-union

PLASTER IMMOBILIZATION

In a case of established non-union without arthritis it will be necessary to maintain the plaster cast for from three to six months, or even longer If at the end of six months there is no change in the clinical condition or x-ray appearance operative treatment may be undertaken

OPERATIVE TREATMENT

1 *Drilling of the Fragments*—Under complete aseptic conditions an incision half an inch long is made over the scaphoid parallel to the tendon of the extensor pollicis longus The wrist is placed in ulnar adduction and the distal fragment exposed Two drill-holes are made through the bone, starting from the radial aspect of the distal fragment and drilling through the fracture into the proximal fragment The direction and depth of the drill is determined by the fluoroscope After-treatment consists of immobilization in plaster as before

2 *Bone-grafting*—This is more certain than either of the other two methods, and may be used if these fail or if for economic reasons the patient wishes to obtain union in the shortest possible time A curved incision three inches long is made over the dorsal and radial aspect of the scaphoid, with its concavity towards the ulnar side of the hand The extensor pollicis longus is retracted medially and the abductor pollicis laterally The fracture is exposed and a three-eighth inch electric drill is introduced into the radial aspect of the distal fragment and passed through the fracture into the proximal fragment The wrist must be in ulnar adduction It is wise at this stage to take an x-ray photograph with the drill in position A bone-graft, three eighths of an inch wide and the necessary length as determined by the x-ray photograph, is cut either from the tibia or the lower third of the ulna and inserted, care being taken to see that it does not project from the distal fragment Union should take place in from three to four months

Non-union with Arthritis

Non-union will inevitably lead to arthritis of the wrist-joint, chiefly between the radius and the proximal fragment of the scaphoid This causes gradually increasing pain and disability

Palliative Treatment—A light celluloid splint similar to the dorsal plaster strip may be worn It should be made from a cast by a surgical instrument maker and in limiting the movements of the wrist it will give considerable relief

Operative Treatment—Removal of the scaphoid bone alone gives a poor result as the hand tends to go into radial adduction with consequent stiffness and weakness of the grip If the scaphoid is to be removed it is better to remove the whole proximal row of the carpus This results in a wrist and hand weaker than normal but comparatively painless

Arthrodesis of the Wrist

This is carried out by means of a large bone graft extending from the radius to the base of the third metacarpal Union takes place in four months and results in a strong painless hand but of course with a stiff wrist This is probably the treatment of choice in a comparatively young and active patient with arthritis as a result of non union of the scaphoid

CHILDREN WITH DEFECTIVE HEARING

REPORT OF COMMITTEE OF INQUIRY

The publication of the Report[1] of the Committee of Inquiry into Problems relating to Children with Defective Hearing brings to an end a task of great complexity and difficulty extending over a period of four years The terms of reference assigned to the Committee— To inquire into and report upon the medical educational and social aspects of the problems attending children suffering from defects of hearing not amounting to total deafness —indicate the wide field the committee had to cover

Classification by Grades

The first step undertaken was the classification of children with defective hearing It was considered best that this should be done on an educational basis rather than on grounds of hearing loss or other factors The Committee showed great wisdom in eliminating the familiar but vague and almost meaningless terminology used hitherto Indefinite terms such as hard of hearing partially deaf semi mute semi deaf and so on have always meant one thing to one observer and something different to another and were bound to give rise to confusion In place of these terms a system of grading is recommended in which all children suffering from hearing defects fall within Grades I, II or III, Grade II is also subdivided into Grades IIA and IIB Each grade defines the type of child suitable to come within its embrace It provides a standard for hearing and understanding the conversational voice and for the range of hearing as tested by both the gramophone and pure tone audiometers Other qualifications are given and an estimate of the number per thousand children in average attendance at elementary schools has been made for each grade This is a scientific classification permitting no misunderstanding and should be welcomed by all

Problems of Causation

The second chapter of the report deals with the causation prevention and treatment of defective hearing The various diseases which cause defective hearing most of them in varying degree infectious are set out Tables are given showing the relative numerical importance of these conditions in the production of the defect Table III (p 8), for example shows the greatly reduced incidence of congenital syphilis as a cause of acquired defective hearing In 1919 congenital syphilis was responsible for 9·2 per cent of the total acquired cases among the school children of London, as compared with 1·5 per cent in 1936

The importance of suppurative otitis media as a cause of defects in hearing is stressed The incidence in infants and children under 5 the incidence in children of school age otitis media in public boarding schools the relation between otitis media and the various infectious diseases environmental and dietetic factors in the aetiology of otitis media and other relevant matters are discussed Emphasis is laid on the importance of suppurative otitis media in the early months and years of life its incidence is greatest then and gradually diminishes as age advances Attention is also drawn to the frequency of middle ear catarrh as a cause of defective hearing

Prevention and Treatment

Agencies for the prevention of defective hearing are discussed in detail and classified thus (1) natural immunity to the diseases most usually complicated by infection of the ear (2) artificially acquired immunity (3) general resistance increased by diet good environment, fresh air etc (4) limitation of infection (5) treatment of streptococcal infections by drugs (6) prevention of recurrence of infection of the ear and (7) maintenance of hygienic conditions in the nasopharynx The view is expressed that the use of sulphonamide compounds should greatly reduce the incidence of complications following throat infections (otitis media mastoid disease and septicaemia) especially if the treatment be administered early Experience so far is hardly sufficient to support this view but it seems likely that this opinion will prove correct

In discussing the maintenance of hygienic conditions in the nasopharynx the Committee recommend that nasal hygiene and breathing exercises should be adopted in all schools It suggests as an ideal that the first two minutes of both morning and afternoon sessions should be spent in this way The nose should first be cleared in the correct manner—which need take no longer than about half a minute—and the remainder of the time should be spent in deep breathing *in* and *out* through the nose This is important In the first place it would detect at once children who have difficulty in or are incapable of, clearing the nose or breathing properly such children should forthwith be referred to the otologist Secondly the children would tend to be more alert and capable of greater mental effort with a clear nose and well-ventilated lungs It might be mentioned however that no strain whatever should accompany the breathing exercises and correct posture should be maintained

So far as treatment is concerned in discussing the organization of an aural scheme the need for co-operation between the school medical service and the maternity and child welfare service in the ascertainment and treatment of ear defects is emphasized as is the need for linking up the aural scheme with arrangements for the control and treatment of infectious diseases Various special methods of treatment are referred to including zinc ionization for chronic otorrhoea and diastolization for certain nasal defects and their sequelae both of which have proved of great value

Testing Hearing

Chapter III of the report is concerned with methods of testing hearing The Committee recommends routine group testing of all children in ordinary schools with the gramophone audiometer as being essential to any scheme for the ascertainment and treatment of children with defective hearing The use of the pure tone audiometer, too, is recommended so that the acuity of hearing

minimum of the scale for general trained staff nurses) Furthermore any nurse who is State registered in a supplementary branch of nursing should be allowed to train in one of the council's general hospitals entering at the third year salary rate (£45) and receiving after the first year for the remainder of the period of training the fourth year rate (£50) All such general trained staff who desire to take midwifery training Part I will also be appointed for the requisite period of training normally six months as staff nurse pupil midwives with a salary of £50 a year together with full residential emoluments and payment by the Council for the necessary lectures It is also proposed that of the 2 600 positions on the fixed establishment now graded as staff nurse about 2 100 shall eventually be redesignated deputy sister The commencing pay of general trained deputy sisters is to be fixed at £75 a year, rising after twelve months service to £80 (the present maximum for staff nurses) with an additional £5 a year for staff nurses holding special certificates The salary scale of deputy sisters State registered in fever or children's nursing is to be £65 £5 £80 a year Another proposal is that the present trial period of four months for probationer nurses should be abolished and that their first year's service should be on probation

Control of Puerperal Sepsis

The annual report for 1937 of Queen Charlotte's Maternity Hospital states that the great improvement in results which followed the introduction of treatment by prontosil early in 1936 has happily been maintained during the year under review There can be little doubt now that the whole outlook in the treatment of puerperal sepsis has changed very much for the better It is also suggested that it may be possible to employ these new drugs where there is special risk of infection in the confinement for the prevention as well as the cure of sepsis This possibility is being further investigated in the laboratory During the year under review 441 swabs from doctors, midwives and infected cases were submitted for examination Suitable strains of haemolytic streptococci and the necessary serum were also sent out to laboratories in this and other countries in order to facilitate the adoption of the newer methods of differentiation Queen Charlotte's has thus been able to assist in the establishment of a number of special investigation centres which are essential for the ultimate control of puerperal fever throughout the country Further research work in connexion with prontosil and allied drugs has elicited a number of new facts but the report states that a full understanding of their mode of action has not yet been reached The investigations of the laboratories have, however extended the use of prontosil by hospitals and practitioners in cases of sepsis due to haemolytic streptococcal infections with satisfactory results The report records the award of the William Julius Mickle Fellowship for 1938 to Dr Leonard Colebrook director of the research laboratories and of the Nicholls Fellowship to Dr H Fuller, the hospital's biochemist

The Croydon Obstetric Service

The annual report for 1936 of the Obstetric Service Public Health Department County Borough of Croydon records a maternal death rate for the borough of 3 85 per thousand live births The mortality for booked cases dealt with by the service was 1 6 per thousand The infant death rate for the first twenty one days of life fell from 25 per thousand live births in 1935 to 14 in 1936 An appendix to the report states that the Croydon obstetric service aims at the ideal of complete ante natal natal and post natal medical supervision under the same whole-time medical officer The ante natal clinics are in the charge of a lady assistant medical officer of health for obstetrics Almoners and two health visitors also attend Any abnormal cases are seen by the obstetrician Patients can arrange for their confinements to take place at Mayday Hospital (the Croydon public health general hospital with forty two maternity beds) at St Mary's Maternity Hospital with thirty two beds of which thirty are retained by the borough council or at their own homes under the care of private medical practitioners or midwives All patients attending the ante natal clinics are instructed to attend the post natal clinic six weeks after delivery This is conducted by the obstetrician, whose services are also available for consultation with practitioners in respect of patients who cannot pay the fees of a specialist There were twenty-eight of these consultations during the year

Cancer Research in Yorkshire

The annual report (1937–8) of the Yorkshire Council of the British Empire Cancer Campaign states that since its inception a sum of over £160 000 has been expended a praiseworthy contribution from Yorkshire towards the solution of this problem In the Department of Experimental Pathology and Cancer Research of the University of Leeds studies in experimental carcinogenesis have been continued and the present findings tend to show that carcinogenic substances act not only on the epithelial cells which ultimately supply the tumour cells but also on the deeper tissues It is suggested that this latter effect is of greater importance from the point of view of carcinogenesis If this hypothesis is justified it seems possible that the ultimate neoplastic effect may be attributable to impairment of nutrition of the epithelial cells Such a conclusion is supported by evidence adduced in previous reports showing that functional ischaemia of tissues is an important determining factor in the emergence of tumours With regard to studies concerning glycolysis in muscle it was found in the course of the previous year's work that glycolysis in muscle extracts requires in addition to the already accepted co-enzymes (adenosine triphosphate cozymohexase and cozymase) another co enzyme of so far unknown function It has since been demonstrated that the new co-enzyme factor consists of at least two additional separate co-enzymes The first is hexose diphosphate the mode of action of the second has not yet been proved though it appears probable that a hitherto undescribed co enzyme functions in the conversion of 3 phosphoglyceric acid to 2 phosphoglyceric acid Experiments are being continued with the object of confirming this point and elucidating the chemical nature of the co enzyme

Food Investigation

The Food Investigation Board has just issued its report for 1937 The Board asked the Medical Research Council a question which is constantly arising Is food stored by modern methods as nutritious as fresh food? In a considered reply the Council concludes by saying

The available evidence therefore suggests that modern methods of storing foods cause little depreciation in their nutritive value in fact it may be said that food of good initial quality that has been stored by the best modern methods is likely to be superior in many respects to similar food that, though still technically fresh is in reality stale One substance of important biological significance especially associated with fresh fruit and vegetables—namely vitamin C or ascorbic acid—is well known to be easily destroyed by heat applied either in ordinary cooking or canning to a less extent vitamin B_1 is liable to be similarly affected The past year has been one of great activity on the part of the Board and some of its findings are of more than usual interest The development of rancidity in the fat of herrings during cold storage has been found to be due to certain enzymes and experimental evidence suggests that these are made more active by common salt For this reason herrings that have been frozen in brine need careful washing and glazing before they are stored and there would be a clear advantage if freezing could be carried out satis-

factorily in air so that contact with brine would be avoided. This possibility is being explored. In the case of several varieties of white fish however freezing in brine at a temperature of + 4° F. and storage in the same way at − 22° F. will retain the original texture for up to six months lemon sole were still in a palatable condition after storage in brine at this temperature for two years. Work on the storage of various fruits and on methods for the artificial ripening of imported plums and pears has continued. It has been found that in an atmosphere of 10 per cent. of carbon dioxide 10 per cent. of oxygen and 80 per cent. of nitrogen the growth of fungi rots on strawberries seems to be retarded. The degree of saturation of the fat of the large white pig has been shown to vary greatly and to be influenced by the rate at which the fat is deposited. Pigs on an unrestricted diet have more stearin fat than their litter brothers on a restricted diet and hogs (castrated males) have a more saturated fat than sows (females). The untreated shells of good quality eggs are remarkably resistant to invasion by species of Proteus or of Pseudomonas, as Wilson however readers the shell susceptible to invasion. Other matters which are dealt with in the report are the preservation of peas and asparagus by freezing, the effect of various methods of manuring the changes of sugar content in potatoes the period of curing needed to give a satisfactory colour to bacon and the storage of hothouse grapes broccoli and apples. The report may be obtained from H.M. Stationery Office price 6s. net.

SCOTLAND

Dundee Royal Infirmary's Needs

Speaking at the annual meeting of Dundee Royal Infirmary Mr. Lewis F. Robertson chairman of directors who presided said that the position of the institution was very disquieting and the present state of affairs could not continue. There must be either a substantial increase of revenue or a curtailment of the services provided. The ordinary income had amounted to £45,345 and the expenditure to £56,300 so that with extraordinary expenditure there was a deficit of £8,108. For many years it had been necessary to write off deficits by taking from the reserve fund but at the end of 1937 the sum at credit of reserve amounting to £6,377 had been insufficient to meet these deficits. The year 1938 therefore started with a debit balance of £1,474. More revenue might be obtained from some of the country districts for which the Infirmary provided a constant and much-used service and an organizing collector would be appointed.

Tuberculosis Trust

The fiftieth anniversary of the beginning of the anti-tuberculosis work undertaken by the Royal Victoria Hospital Tuberculosis Trust is recorded in the annual report of this Trust for the year to June 30 1937. The establishment of the tuberculosis dispensary at 13 Bank Street Edinburgh on November 22 1887 gave a new direction to the treatment of tuberculosis shifting it from the cure of the advanced case to the search for and cure of early cases of tuberculous infection. The dispensary was devised to serve as the centre of all other anti-tuberculosis activities. This was accomplished by an accurate system of examination and records followed up by home visitation by a doctor and a staff of specially trained nurses, the dispensary also acting as a clearing house where patients were sorted out for home or sanatorium treatment. A study of the first 1,000 cases indicated the desirability of the notification of tuberculosis to the public authorities. Fourteen years later the second dispensary was established in France and gradually there was a growing realization of the significance of the Edinburgh scheme from which grew the official plan for control of tuberculosis in Great Britain adopted in 1913 [illegible] also the foundation upon which anti-tuberculosis work in the United States was built up. In 1887 four out of every five deaths were due to tuberculosis throughout the West of Scotland while now in Great Britain has been reduced to 28 per cent. and in America to 22 per cent. of all [illegible] deaths. The Trust now maintains Southfield Sanatorium Corstorphine in connection with the Royal Victoria Dispensary and in 1921 established at Greenmount Farm a tuberculosis herd of cattle for the provision of special milk. A number of investigations have been carried out at the Sanatorium Colonies including improved methods for the detection of the tubercle bacilles from [illegible] observations on the seasonal variations in tuberculous [illegible] experimental work on the channels of infection and the [illegible] of tuberculosis. Two nurse commissioners have been appointed for work in the north of Scotland by the Tuberculosis Trust in collaboration with the British Red Cross Society and other bodies and it may be noted that the diminution of the death rate from tuberculosis during the past ten years has been greatly noticeable in the five counties covered by the work of these nurses.

Scottish Mental Hospitals Pathological Board

The annual report for 1937 of the Scottish Mental Hospitals Pathological Board states that the demonstrations provided during the year were well attended by medical officers of contributing hospitals. Dr. A. C. P. Campbell successor to Dr. (now Professor) J. A. Biggart as the Board's pathologist was granted leave of absence in America for a short period. There he visited laboratories in various centres and attended the symposium on the cerebral circulation held by the American Association for Research in Nervous and Mental Disease. With regard to research the following studies are now in progress: the experimental production of spasm of the cerebral vessels; an embryological study of the development of the cerebral capillaries; an experimental study of the quantitative variation of the cerebral capillary bed under different conditions; a review of a series of cases of Wernicke's encephalopathy; and the experimental production of hypo- and hyperthermia by hypothalamic lesions. The report records a further considerable increase in the number of teaching specimens, both microscopic and histological now available and in the collection of lantern slides at the museum. Much of the histological material filed during the year is stated to be of great teaching value.

INDIA

Bengal Housing Conditions

Attention is drawn to the backward state of town planning and housing conditions in Bengal by Lieutenant-Colonel A. C. Chatterji I.M.S., in his report as director of public health in Bengal. He mentions first that in 1936 a lower birth rate was recorded than in all other Provinces excepting the North-West Frontier Province Assam and Sind while the death rate was higher in Bengal than in all other Provinces except Bombay, the Central Provinces, and Orissa. The rate of natural increase was nine per thousand of population as compared with ten in 1935. Seven districts showed improvement and fourteen showed retrogression in their decadent areas during 1936 while in Howrah the position remained unaltered. In five districts no decadent area was notified. Colonel Chatterji remarks that in urban areas, excepting Calcutta proper buildings have been rising in a haphazard manner without any kind of systematic planning, while even in Calcutta the outskirts are full of very insanitary overcrowded dwellings. Of 118 municipalities,

excluding Calcutta only seventeen have framed by laws and promulgated them The urban areas are becoming very congested especially those in process of industrialization and there are large numbers of houses with no adequate ventilation, damp proofing, outlet for kitchen smoke and suitable drainage All these adverse conditions react unfavourably upon the health of the inhabitants more so upon the pregnant mothers and the infants This is further very seriously aggravated by the overcrowding in the individual houses partly due to the low standard of living and partly to the lack of suitable accommodation Not only do two or three families live in houses which are only adequate for single families but two or three generations inhabit the same room creating most unhealthy conditions In the rural areas where more than forty seven million people live the absence of a Village Planning Act and the lack of desire and initiative on the part of the population itself have resulted in the haphazard growth of homesteads with innumerable breeding places for mosquitos caused by excavating the ground indiscriminately all over the villages in order to obtain earth for building the huts Each year about half a million deaths occur from malaria alone tuberculosis is probably also increasing especially in these malaria infested areas Even in the urban areas three million inhabitants live in such different types of buildings as those constructed entirely of bricks partly of bricks and partly of corrugated sheets or tiles entirely of corrugated sheets daub and wattle mud walls with thatched roofing and bamboo walls with thatched roofing It is therefore suggested that all the municipalities should adopt suitable by laws and that Village Planning and the Small Town Planning Acts should be brought into being

The Punjab Epidemiological Bureau

Epidemiological work is prominent in the activities of the public health department of the Punjab In his report on the public health administration Lieutenant Colonel C M Nicol I M S records that five malaria surveys were undertaken in 1936 in different parts of the Province and that these gave valuable information which could be utilized in organizing preventive measures This work requires very specialized knowledge and the accuracy of the observations is an important factor in the degree of success obtained by efforts directed against the development and spreading of malaria in the regions surveyed The collection of data for the preparation of the annual malaria forecast and the analysis of these data is an essential piece of work which devolves upon the Bureau personnel each year In this connexion the results of spleen examination in school children throughout the Province are examined resulting in the compiling of valuable evidence about endemicity The examination of blood films for the presence of the malaria parasite is a routine procedure Advice is also given by the Bureau in respect of sites for proposed new buildings and institutions particularly as regards the possibility of mosquito breeding in the neighbourhoods In connexion with the Provincial hookworm survey material is systematically examined for signs of hookworm infection —no fewer that 7,789 specimens were scrutinized during the year under review The epidemiologist is responsible for the planning of field work for the Provincial survey and for the co ordination of this work with laboratory investigations Outbreaks of epidemic and other disease are investigated and the necessary laboratory procedures are undertaken Since 1932 much work has been done in connexion with the continued prevalence of cerebrospinal fever in the Borstal Jail at Lahore particularly with a view to segregating carriers An outbreak of suspected pneumonic plague was investigated It is noteworthy that plague which has been absent from the Shiapur district for seven years reappeared in 1935—an indication that no false sense of security should be allowed to develop merely because this disease has not appeared for even a comparatively lengthy period of years In 1936 there was a fall in the incidence of plague in the Punjab, the three largest towns Lahore, Amritsar and Multan being entirely free that no marked degree of success attended the campaign against cerebrospinal fever was attributed to the wide distribution of carriers and the impossibility of determining which of them were capable of transmitting the infection A special pamphlet on food was prepared in 1936 and there was a new set of magic lantern slides on tuberculosis This disease continues to lurk unestimated since notification is far from complete and only mortality figures are obtainable on a large scale in the Province generally Colonel Nicol remarks that there is great need for the extension of the campaign against this disease the most hopeful line of attack being the multiplication of tuberculosis clinics A leprosy survey was begun in 1931 and up to December, 1936 5 574 villages with a gross population of 1 719 960 had been examined in 744 of these villages 1 814 cases of leprosy were found At the end of the year there were eighty leprosy clinics serving both as treatment centres and as centres of propaganda work Since 1927 the birth rate per thousand has risen from 42 3 to 46 9 while the death rate has fallen from 167 5 to 1584 thus the greater the success of the public health department the greater is likely to be the pressure of the population on the land This will have to be countered by a steady improvement of agricultural methods such as will increase the output of the land Some relief will be afforded by an extension of irrigation though the field remaining for this is not large and the ultimate problem remains that of devising some means of birth control

Correspondence

Hepatitis after Prophylactic Serum

SIR —A recent outbreak of poliomyelitis has aroused controversy as to the value of convalescent serum In the *Journal* of September 10 (p 588) Mr G R Girdlestone advocates its use and regrets the statement of Drs Donald Paterson and MacDonald Critchley in the *Times* of August 8 that the disease does not yield to any known treatment applied within the first few days of onset

It is not my object in this letter to discuss the efficacy of convalescent serum treatment for poliomyelitis but rather to draw attention to dangers incurred in its use These dangers appear to me to apply equally to the use of convalescent serum for the treatment of any virus disease

Poliomyelitis has recently been epidemic in this area (North East Essex) but I have not used serum treatment for the cases under my care because I have seen alarming and in some cases fatal results apparently follow the administration of measles convalescent serum and I have felt that similar results might well follow the use of serum in poliomyelitis particularly if given as suggested by Mr Girdlestone without antiseptic preservation That evil effects may follow the use of convalescent serum is a statement of sufficiently wide implication to require very full evidence before it is accepted but I consider that the facts which I have observed merit a preliminary communication Full particulars of the cases will be published shortly

On June 1 1937 seven children housed in one block of a large institution for mental defectives were inoculated with convalescent measles serum to protect them from the disease with which they had recently been in contact Each child received 4 5 c cm of the serum which came from the same batch and which was obtained from a well known reputable firm.

After an interval varying between seventy-eight and eighty-three days these seven children developed jaundice and became severely ill. No other child in the institution at that time had jaundice. The disease in its early stages and in its milder forms appeared to be indistinguishable from so-called infective hepatitis (infectious catarrhal jaundice). Four of the seven cases three developed rapidly increasing signs of liver failure terminating in death. Material derived from post-mortem examination of the fatal cases revealed extensive atrophy of the liver. (Photomicrographs of sections of the liver in two of the cases are enclosed.)

Two months after the onset of the jaundice in the seven children who had been inoculated with convalescent measles serum two other children who had been in contact with the cases but who had not been inoculated with serum developed jaundice. Their illness did not appear to differ in any respect from common infective hepatitis.

The majority of the cases were fully investigated. Van den Bergh's test gave a biphasic or direct positive reaction. Blood culture was negative (three cases). Widal agglutination reaction (three cases). Examination of blood, urine, and post-mortem material for the parasite of Weil's disease were negative. Blood count revealed a polymorphonuclear leucocytosis. Throat swabs were taken in four of the cases and in all were haemolytic streptococci on culture. Levulose tolerance tests were carried out on some cases and showed evidence of impaired liver function.

The investigations did not give much clue as to the aetiology of the condition. The fact that all the original cases had had convalescent measles serum attracted our notice, and was at first considered to be a remarkable coincidence, but this view was revised after reading recent articles by Findlay and MacCallum (1937, 1938) on the association of hepatitis with immunization against yellow fever. These authors noted that among 3,100 persons immunized against this disease with virus and immune serum eighty-nine cases of jaundice developed. The average period between the time of inoculation and the development of hepatitis was between two and three months.

The first report of hepatitis associated with immunization against a virus disease is that of Theiler (1919), who refers to it in connexion with immunization of horses against horse sickness. Of 1,148 animals inoculated twenty-seven developed acute necrosis of the liver in most instances after an interval of sixty-two to seventy-eight days. Among Army horses immunized against horse sickness there was a mortality of 4 to 5 per cent. in one group of 1,411 animals and 20 per cent. in a second group of 1,154 animals. An interesting point is that seven non-immunized and apparently healthy horses died from hepatitis in the same area and during the same time as the illness occurred in the same group of 1,154 animals mentioned above.

Marsh (1937) has recorded the development of hepatitis in horses inoculated with immune serum alone or with mixtures of immune serum and virus for the treatment of equine encephalomyelitis. Of 5,933 horses treated symptoms of hepatitis followed inoculation in eighty-one cases after an interval varying between thirty-two and ninety-two days. In addition eight horses that had not been immunized developed similar symptoms.

Findlay and MacCallum also record a communication to them by Dr. W. S. Gordon noting the occurrence of necrosis of the liver following inoculation of serum antitoxic to *Clostridium welchii*.

The possible theories explaining these recorded facts are fully discussed by Findlay and MacCallum who summarize them as follows: (1) a hepatotoxic virus is introduced with the virus inoculum, or (2) two factors combine to induce the hepatitis—(*a*) a hepatotoxic substance present in the sera or tissue extract injected, (*b*) in the case of man and such as in the case of human beings probably the commonest cause of common infective jaundice. The latter theory appears to me to be the most likely after consideration of the present cases. It would explain satisfactorily the occurrence of secondary cases of jaundice in individuals who have not been inoculated with serum.

In conclusion it is perhaps as well to mention that such serum appeared to the eye of immune serum must be rare. I have not been able to find any other cases recorded in the literature of hepatitis associated with convalescent measles serum in human beings.

C. S. V. PROPERT
Rotherham.

Convalescent Serum in Infantile Paralysis

SIR,—I am sorry that Dr. F. M. R. Walshe (*Journal*, September 17, p. 543) is so confirmed an unbeliever in convalescent serum. So far as the negative evidence is valuable it touches me it disproves the efficacy of serum *as it is generally prepared and used*. In some of the reported cases the cases were not fully alternate or truly comparable in severity, the serum was often not from donors recently convalescent from poliomyelitis, the pre-paralytic stage was often not accurately assessed, there was often delay between the diagnosis and the administration, and doses were often small.

Furthermore the evidence is not all negative. I mentioned Macnamara and Morgan, Jackson and Donovan reviewing the 1936 epidemic of poliomyelitis in Manitoba (*Canad. publ. Hlth J.*, August 1937) give the following table:

Final Results of 161 Cases with Positive Spinal Fluid Findings

Result	Serum administered within 3 days of onset of illness	Serum after 3 days, or all paralytic cases not administered
	Cases	Cases
Recovered without paralysis	51 (92·7)	43 (56·6)
Recovered with residual paralysis	3 (5·5)	23 (30·3)
Died	1 (1·8)	9 (11·8)
Total	55 (100·)	76 (100·)

My plea is that convalescent serum has been condemned on insufficient evidence, and that there are grounds for an appeal and for a further trial.

I have been asked how a doctor is to recognize the pre-paralytic stage of poliomyelitis. The period of the year and the existence of a local epidemic may be suggestive. The child has or has recently had a brief feverish illness commonly pharyngitis. All such patients should be taught to give their knees a good morning and good night kiss. During the fever or associated with a secondary rise the patient complains of stiffness in the neck or back, and when asked to carry out the morning and evening kissing of his knees cannot do so. Poliomyelitis is suspected, *the patient is not moved* but with the least possible delay pathologist, serum, and microscope are brought to his bedside, lumbar puncture is carried out and 5 or 10 c.cm. of cerebrospinal fluid withdrawn, and the needle is left *in situ* while the fluid is examined. At this stage the characteristic "polio" finding is a raised cell count (polymorphonuclear and mononuclear) in a clear or slightly opalescent fluid, and

there is usually some increase of pressure. Should there be need to distinguish poliomyelitis from tuberculous meningitis the chlorides will be found unreduced. If the clinical and cerebrospinal fluid pictures agree about 10 or 20 c.cm. of serum at body temperature is slowly injected intrathecally, the main dose being given intramuscularly or intravenously. The dose is related to the size of the patient. In 12 year olds I have used 50 to 100 c.cm. but I now feel that 200 c.cm., or even more if the illness is severe, may be advisable.—I am, etc.

Oxford, Sept. 19 G. R. GIRDLESTONE.

Human Oil from the Omentum

SIR,—Mr. Cecil P. G. Wakeley's method of treating adherent scars with human oil (*Journal*, September 17, p. 618) has given such good results in his hands that it is likely to become a standard method. I am therefore alarmed at the abuse to which the omentum may be subjected as a result of this article.

At the present time our knowledge of what can be done with the omentum is scanty. I have now seen sufficient tragedies from interference with the omentum during operations for acute appendicitis, etc., to convince me that it is an organ which must be given the greatest respect. The devitalized fatty stump which must be left distal to the ligatures when it is amputated is a source of the greatest danger. It is an ideal culture medium for the bacteria which are present in many unperforated abdominal inflammations. Suppuration with abscess formation, or more generalized peritonitis, is likely to follow. If the omentum must be amputated in an operation for acute appendicitis then all the conditions which indicate drainage are produced even though the appendix has not perforated. In addition to this immediate danger to life there is the remote danger from adhesions which so frequently form about omental stumps. In making a necropsy on subjects who have had an abdominal operation I always open away from the scars and make a preliminary survey of the operation area. At present I share the dilemma of Dr. Hugh Auchincloss. Should the omentum be pulled down over the operation site because of its policeman role or should it be rolled well away from the region because of its habit of forming adhesions? Careful case records will eventually solve these problems, but the omentum will always be a structure which requires the greatest care in handling.

It is difficult to believe that oil from the omentum should be any more valuable than oil from the many other fat deposits of the body which can be tapped without any risk to life or health. If, however, there is some special value in omental oil, then it seems to me that the only justifiable source of supply is the hypertrophied omentum found in hernial sacs. Because of its bulk this must frequently be amputated. The stump even here may be a source of danger. Last week I made a necropsy on the body of a middle-aged man who hanged himself about a month after such an operation for a right inguinal hernia. The operation had been technically perfect, the wound was very neat and well healed. The omentum reached down to the pelvis and its stump was an ugly mass of dark necrotic fat and fibrous shreds about which neighbouring structures were becoming adherent. If one of Mr. Wakeley's omental donors should hang himself during convalescence I should like to see the necropsy. I am sure Mr. Wakeley would sooner have adherent scars of the skin than the condition we would see.—I am, etc.

G. R. OSBORN
Derby, Sept. 17 Pathologist, Derbyshire Royal Infirmary

A Strict Vegetarian Diet

SIR,—Sir Leonard Hill's interesting article under this title gives a single day's food consumption of a 9 year old boy as follows: one fairly thick slice of pineapple weighing about 6 oz.; baked spinach and onion pie with a very thin crust made of wholemeal flour, cheese, and milk, about 10 oz. in all; two apples, one orange, and two small tomatoes in all about 12 oz., including the skin of the orange; one small ice. This regimen was said by the subject's father to be typical. It was noted that the boy weighed 59 lb. and was fifty-two inches in height; a measurement of the twenty-four hour urinary output of nitrogen gave 4·43 grammes corresponding to 28 grammes protein consumption, a basal metabolism test showed an oxygen consumption of 215 c.cm. per minute corresponding to 1,486 calories per day. (This was considered due to the circumstances to be a somewhat high figure. It may be noted that the mean value for a normal subject of age, sex, weight, and height given is found to be 1,224 calories per day, calculating from Fig. 20 and Fig. 25 of the latest edition of *Basal Metabolism in Health and Disease* by E. F. DuBois.)

To facilitate the calculation of the calorie value and protein content of the foods listed above these have been considered to be equivalent to 6 oz. pineapple, 4 oz. spinach, 4 oz. onion, 2 oz. wholemeal flour, 4 oz. apple, 4 oz. orange, 2 oz. tomato, and 2 oz. ice cream. Taking calorie values and protein contents of these articles of diet from any standard textbook on nutrition it is found that the calorie value of the whole day's diet is about 650 and the protein content 18 grammes. These are maximal figures obtained by assuming the fruits to contain no inedible portion and accepting the upper figure where a range is given for any item.

As the diet yields only half enough energy to maintain the basal metabolism and two-thirds of the protein necessary to account for the very small observed urinary nitrogen output, it is impossible to escape the conclusion that the regimen described to Sir Leonard was incorrectly described. The subject could not long survive upon the given quantities of the foods described, and the observation that he was in good health leads to the conclusion that he must ordinarily consume much more food than that which is claimed to be typical of a day's diet.—I am, etc.,

Durham, N. Carolina, U.S.A., Sept. 7 W. J. DANN.

SIR,—This letter is apropos the paper on a strict vegetarian diet by Sir Leonard Hill (*Journal*, August 20, p. 417). It is very difficult to reconcile the small number of calories which this boy's diet is alleged to contain with his activities, his excellent state of health, and certain well-known facts of physiology. In the past after subjecting all of the data of such reports to careful analysis the verdict has invariably been "not proven," and as I shall presently show, this appears to be the verdict in this case.

There is no doubt that our food requirements are less than the generally accepted standards indicate. From my experiences with over 6,000 diabetics I have been convinced for a number of years that our dietary standards reflect habits rather than actual caloric needs. Diabetics seem to do very well year in and year out with diets of 2,000 calories a day and less, and their occupations in general, differ very little from those of non-diabetics. None of these diets however, contains the small number of calories (800) reported in the above-mentioned case. That this boy's intake of food is appreciably different,

qualitatively and quantitatively, from that which it is alleged to be is suggested from the following

The rate at which a child grows depends not only upon the protein content of the diet quantitatively (grammes per kilogramme of body weight) but also upon the character of the proteins—that is their amino acid content From many experiences with juvenile diabetics our data clearly show that stunting results when vegetables account for more than 50 per cent of the total protein content of the diet, to prevent retardation of growth at least this proportion of the total protein must be in the form of animal foods—meat eggs, milk etc There are vegetable proteins which have approximately the same growth-promoting value as animal proteins (the soya bean is an example), but according to the description of the diet this boy is not receiving any of these vegetables In isolated cases we have found it possible to prevent stunting with smaller amounts of animal protein In such cases however, this was accomplished only by increasing the number of grammes of protein per kilogramme of body weight In view therefore of (*a*) the very small amount of protein which this boy's diet is alleged to contain, and (*b*) the excellent rate at which he is growing—according to English standards this boy is about three inches taller than the mean height for his age see the Annual Report of the Chief Medical Officer of the Board of Education for 1927—one must conclude that the biological (growth promoting etc) value of these vegetable proteins not only is as high as that of animal proteins but is actually higher This is not in accord with their known amino acid contents Parenthetically it may be observed that this boy is not on 'a strict vegetarian diet' There is at least a small amount of animal protein in the cheese and milk in the food at lunch and in the sour milk and the cake allowed probably contains a little milk The amounts are however too small to account for the discrepancy between the actual and theoretically expected state of the boy's nutrition

It is still more difficult to reconcile the energy content of this boy's diet (800 calories each twenty four hours) with his body weight and expenditure of energy since the law of the conservation of energy holds in the human body as elsewhere The oxygen consumption under conditions of basal metabolism was found to be 215 c.cm per minute This corresponds to an expenditure of approximately 1 500 calories per twenty four hours This is a very large expenditure of energy for a boy of his age height, and weight under these conditions but from the description given—excitement during the test—the conditions were probably not strictly basal Assuming however, a *normal* expenditure for a boy of his age, height, and weight —that is about 1 080 calories per twenty four hours (*Amer J Dis Child* 1938, **55** 455)—there is still a marked disproportion between the theoretically expected and the actual body weight Thus, to the expenditure of energy under basal conditions—1,080 calories—it is necessary to add about fifty calories for the specific dynamic action of the food, and to this total must be added the expenditure of energy during work Assuming that the boy does no other muscular work but walk the five miles a day as described—'to church and back'—and assuming that he walks at the very slow rate of one mile per hour only he expends, in addition to the energy under basal conditions approximately one calorie per kilogramme of body weight per hour or about 135 calories per day (body weight is approximately 27 kilogrammes) The total expenditure of energy is therefore about 1,265 calories Since his diet is alleged to yield about 800 calories only this small amount of muscular activity alone accounts for a deficit of 465 calories per twenty four hours In one year, therefore, this boy should *lose* about 40 lb (465 × 365 − 452 × 9·3) Since he weighs 59 lb he should disappear completely in less than two years Actually his rate of development is excellent

The loss of weight estimated above is conservative, since, as it will be noted it assumes (*a*) a maximum energy value for fat (9·3 calories per gramme) and (*b*) that loss of body weight is confined entirely to fat The objection may be raised that the allowance of 135 calories for the walk of five miles is too liberal It should be observed that assuming the boy did nothing whatever but lie quietly in bed throughout the whole twenty four hours of the day, and assuming that his heat production under basal metabolism conditions is 1 080 calories only there is still a deficit of about 280 calories per day which in one year should result in a loss of about 25 lb —(1080–800) × 365 − 9·3 × 452 The conclusion therefore seems to be that this boy is either eating more food than is shown in the diet or that the law of the conservation of energy does not apply to him

We now come to the laboratory data The statement is made that "confirmatory of his father's claim that the boy lives on a diet much like that given by his parents is the *fact* that the total nitrogen determination was 4·43 grammes in the twenty-four hours urine The urea came out a total of 9·65 grammes in twenty four hours' With regard to the small amount of nitrogen in the urine, it is necessary to observe that the nitrogen content of a child's urine, unlike that in adults, is no indication of the total protein metabolism—the output of nitrogen rarely equals the intake—because children tend to store appreciable amounts of protein for growth Low caloric diets in which carbohydrates dominate also tend towards retention of nitrogen That the nitrogen metabolism in this case requires reinvestigation is clearly shown by the following considerations

Urea has this structure CON_2H_4 Its molecular weight is therefore 60, and for every 60 parts of urea there are 28 parts of nitrogen The *maximum* amount of urea which 4·43 grammes of nitrogen—the amount found in the urine—is capable of yielding is therefore 9·48 grammes only (2·14 × 4·43) Actually the urine is said to have contained 9·65 grammes The difference between the theoretically possible and the actual amount of urea is admittedly small and within the limits of the experimental error of the test It must however also be assumed (*a*) that this boy's urine contained no amino acids, which normally account for 3 to 5 per cent of the total nitrogen, (*b*) that it contained no ammonia which also normally accounts for 3 to 5 per cent of the total nitrogen, (*c*) that it was absolutely free of creatinine, about 37 per cent of which is nitrogen, (*d*) that it was also free of uric acid about 33 per cent of which is nitrogen, and (*e*) that it was also free of the "residual" nitrogenous substances all of which as a rule account for about 20 per cent of the total nitrogen content of normal urine No human urine has ever been found free of these nitrogenous substances The discrepancy is still more marked when consideration is given to the fact that though urea accounts for about 80 to 90 per cent of the total nitrogen in the urine with ordinary diets, it accounts for 60 to 70 per cent only when the diet is low in calories and low in proteins It is obvious therefore that an error occurred either in the determination of the total nitrogen or in the estimation of the urea

With regard to the observation of not having 'come across so low a value for protein metabolism [4·43 grammes of nitrogen] before," may I respectfully draw Sir Leonard Hill's attention to a number of reports of less than 2 grammes of nitrogen a day (*Skand Arch Physiol* 1900, **10**, 91, *Biochem J* 1922, **16**, 131 and *J Biol Chem* 1924, **61**, 355, 1926, **68**, 15, 1926, **76**, 391, and 1932, **95**, 327) and one of my reports of a juvenile diabetic with less than 1 gramme per day (*New Engl J Med* 1931, **204**, 799)—I am, etc,

I M RABINOWITCH

Montreal General Hospital Canada Sept 1

Tannic Acid Dressings in Wounds of the Fingers

SIR—In the treatment of wounds of the fingers and hands tannic acid has certain distinct advantages which do not appear to be widely realized Cases particularly suitable for treatment with tannic acid are (1) those in which the tip of the finger has been cut off as by a guillotine, (2) cases in which an area of skin has been

avulsed so that suture cannot be performed satisfactorily and (3) cases in which a tendon has been exposed It tannic acid is not used in the treatment of the first type of case then either an amputation is performed and a flap obtained by sacrificing the greater part if not all of the terminal phalanx or the wound has to be dressed repeatedly, with considerable discomfort and slow healing and sepsis are practically inevitable It tannic acid is used the freedom from pain is notable there are no unpleasant dressings that stick and have to be soaked off and healing is excellent and more rapid no doubt because sepsis is avoided by leaving the wound once it is dressed undisturbed This method does not give a soundly healed scar quite as rapidly as does a well-performed amputation but it saves the maximum amount of the phalanx Although the gain in time with an amputation may be a source of satisfaction to the employer the loss of a terminal phalanx is a source of considerable grief to the employee especially in the case of a lady

The technique is as follows the wound toilet is undertaken in the usual way under local anaesthesia the part is then soaked in a 1 in 1 000 watery flavine solution for at least fifteen to twenty minutes The part is dried and tannic acid is applied one of the many forms of tannic acid jelly is satisfactory and convenient but if preferred, a tannic acid compress using up to a 40 per cent solution can be employed Later dressings consist merely in replacing the top wool and the bandage The tannic acid is left until it comes off of its own accord —I am etc

London, S W.2 W D PARK.

The Occipito-posterior Case

SIR —Concerning the diagnosis of occipito posterior positions of the vertex the sign on which I have always placed the greatest reliance is not mentioned in Professor Chassar Moir's article (*Journal* September 10 p 555) nor have I ever seen it mentioned in any standard work on midwifery The os uteri in the early stages of parturition is invariably related to the summit of the presenting part of the vertex If in the early stages, when one finger can be admitted, the os uteri approaches the sacrum, the position is occipito-posterior If it approaches the pubis the position is occipito anterior In the later stages when the os admits three fingers the sign does not appear to be so convincing This observation is based on three thousand cases attended in a country district —I am etc

Beccles September 12 H WOOD HILL

SIR,—Since my former note (*Journal* 1921 2 782) there has been much discussion but the occipito posterior presentation remains the bugbear of domestic practice and the associated deflexion of the head is not clearly accounted for All may agree that when the foetal-pelvic fit is easy spontaneous delivery is likely when the fit is close the normal flexion of the foetus is likely to be lost If the flexion persists the occiput will impinge on the pelvic slope and make the long forward rotation of 135 degrees If deflexion occurs the sinciput will impinge on the pelvic slope and rotate forward 45 degrees With long rotation labour at best is prolonged and exhausting with deflexion the passage of the head round the pubic arch is difficult In my note of 1921 two claims were made (1) that it is in most cases possible to make the diagnosis of impending posterior occiput and (2) that in many cases it is possible to avert it by manipulative methods Each of these claims has been justified by experience, and the cases of failure show that there are factors which call for further study In relation to the statement that when the pelvic fit is close the normal flexion of the foetal head is likely to be lost one may point out that the head contour is truly oval—not elliptic —and that it has for space to fit into one of two ovals with its axis in the right or left oblique diameter With the occiput posteriorly the large end of the head oval is at the narrow end of the pelvic oval Entrance into the pelvic brim in this relation brings a deflecting pressure to bear on the occiput May I renew my appeal to practitioners to try to diagnose 'impending posterior occiput and avert it by manipulative methods In every case in which they succeed they will save the patient the delay of a long rotation and perhaps the difficulties and anxieties of a face to-pubis delivery —I am etc,

Dundee Sept 13 R C BUIST M D

Treatment of Malaria

SIR —The article published under this heading in your issue of July 30 (p 227) conveys a poor impression of the atebrin-plasmoquine treatment The statement that the simultaneous administration of atebrin and plasmoquine appears to aggravate the toxicity of each and is not to be advised is so emphatic that it might become a dogma of anti malarial treatment Actually the simultaneous administration method has given me results incomparably better than those that I have received from any other form of treatment so that I venture to suggest that the above statement deserves to be qualified

Any drugs which undertake to eradicate malaria in a five day course must possess a powerful toxicity to administer such drugs in normal dosage to patients already in a toxic condition as the result of acute febrile infection is to invite trouble These drugs should not be administered on any but a full stomach and the acute malarial patient is seldom a hearty eater

In this locality a majority of our cases are of subtertian infection I treat these in the acute stages with large doses of quinine and small doses of plasmochin compound When all symptoms have disappeared with the patient under daily observation and with the assurance that he or she is feeling and feeding well I institute the atabrine-plasmochin co treatment (one tablet of each t d s p c) Patients are usually fit to begin the course within ten days of the onset of fever The course may exceed the prescribed five days I do not use plasmochin simplex The alternative spellings of the names are I believe only of proprietary significance

With the above routine which I have practised since 1933 less than 10 per cent of my patients have developed toxic symptoms and more than 75 per cent have had no recurrence of malaria —I am etc

Tuberculosis Dispensaries or Chest Clinics?

SIR —With the remarks of Dr Philip Ellman in his letter in your issue of September 10 (p 593) under the above heading and with those of Dr G S Todd at the Annual Meeting of the British Medical Association (Tuberculosis Section), reported in your issue of August 6 (p 312) where they deprecate the use of the term tuberculosis dispensary and suggest the title chest clinic I am in complete agreement

It is the common experience at these centres, as Dr Ellman points out that a very large percentage of patients

prove on investigation to be either free from disease or suffering from some pulmonary disease other than tuberculosis, or frequently from extrapulmonary disease. How often, for example, are bronchiectasis, intrathoracic neoplasm and para-nasal sinus infection with its broncho-pulmonary complications or sequelae diagnosed there? A properly equipped dispensary with its facilities for clinical bacteriological and radiological investigation becomes *ipso facto* a chest clinic. For a practitioner to have to recommend his patient to a "T.B. dispensary" with a request for an opinion solely as to the presence or absence of tuberculosis of the lungs or merely to confirm his suspicion, is not in the best interests of the practice of medicine and is not devoid of harm to the patient who, fearing the worst, is filled with apprehension and anxiety, and through this fear may fail to take his doctor's advice and may go so far as to remove his name from the practitioner's list. If, however, a recommendation was made to have his chest, or, say the cause of his continued 'cold,' etc., investigated at the "chest clinic," there would be less hesitation on his part to attend.

The chest clinic, with its valuable clientele, properly equipped and staffed by the local authority concerned and having as in my own county an appropriate liaison with the local general hospital, could perform a useful function in the training of the medical student and future practitioner: there ample opportunities would be found of acquiring a knowledge of chest disease in general and of tuberculosis in particular, and the future doctor could come to appreciate the proper place of the chest clinic in the scheme of things, and would be only too keen to avail himself of its help in his future difficulties. Again, the chest clinic should play its part, as it does in my area, in the schemes now functioning in certain centres for postgraduate courses for general practitioners under the auspices of the Ministry of Health.

Let us drop the obsolete term 'tuberculosis dispensary" and assume the more appropriate title "chest clinic." Most of our new clients do not suffer from tuberculosis, and we in charge dispense neither medicines nor cod liver oil.—I am, etc.,

Cambridge, September 12 W. PATON PHILIP

SIR,—Dr. Gregory Kayne and I are, I am glad to note, in substantial agreement (*Journal*, September 17, p. 634). Actually in my original letter (September 10, p. 593) I suggested "municipal *or* chest clinic" ('or' being omitted through error) but in my paper to the Tuberculosis Association at the Cambridge meeting (*Medical Officer* 1934, **51**, 236), from which I quoted, I concluded:

The title 'tuberculosis dispensary' should be replaced by the designation 'the chest or municipal clinic,' or be constituted a special department of a general and if possible a teaching, hospital, as already exists in a few cases.

With Dr. Kayne's condemnation of the term "tuberculosis officer" I am in complete agreement. The recognition of the systemic nature of tuberculosis and hence the need for the "tuberculosis physician" having a wide knowledge of medicine in general and diseases of the chest in particular would surely in these days be accepted by all. As Dr. Maurice Davidson so aptly points out, "the study of tuberculosis, like other specialties, suffers not a little from the evils of departmentalism." On the other hand, once a patient is definitely known to be suffering from tuberculosis his education for his 'tuberculous career' must be a complete one, and I agree that there should be no subterfuge. This point, however, is outside the realm of the present discussion.—I am, etc.,

London, W.1, Sept. 16 PHILIP ELLMAN

Fracture of the Neck of the Femur

SIR,—Such a flood of literature on this subject has been let loose in recent months that a two-years ban has been suggested. Yet I cannot resist commenting on Professor E. W. Hey Groves's (*Journal*, September 17, p. 633) claim that 'from the moment that the operation begins with the insertion of the drill guide until that in which the nail is driven home and the skin incision closed need not occupy more than five minutes." This must mean that there is no radiographic confirmation of the position, or of the degree of penetration of the drill guide, for even with modern technique it takes about four minutes to expose and to develop antero-posterior and lateral radiographs. If this is what Professor Hey Groves implies, then one of the most vital steps of the operation has been omitted. If the preliminary tests are considered infallible, which I cannot for a moment accept, then why use a guide at all? In what sense is it a "guide" unless we have *confirmed that it is precisely in the right place*?

I am sure that I am not alone in having seen not one but many cases of nails driven into the femoral neck which have missed the head altogether and which have penetrated the front or the back, the top or the bottom, *in fact anywhere except the middle*. The more we encourage the belief that this is a procedure to be completed in five minutes in the patient's bedroom the more we shall see of these cases. These are the failures. The failures are not coming from surgeons who spend an extra *five minutes in securing radiographic confirmation* of every step. Moreover, patients do not suffer by these precautions. How does quietly standing by for a few moments while films are developed increase the shock?

There is nothing prohibitive about the extra-articular insertion of a nail under spinal or, if necessary, local anæsthesia, whether the activities in the theatre occupy five or thirty-five minutes. The "operating time," used in the strict sense of time occupied in cutting and stitching, is about the same in each case. So is the shock. Then let us insist on accuracy and forget the clock.—I am, etc.,

Liverpool, Sept. 18 R. WATSON JONES

Aural Vertigo

SIR,—I have read with much interest Dr. W. Russell Brain's lucid exposition of the difficult subject of vertigo in the *Journal* of September 17 (p. 605). Since he refers to some recent work of mine on aural vertigo I should be grateful for the opportunity of discussing a few of the points in his paper, as I was unfortunately unable to be in Plymouth for the Annual Meeting of the British Medical Association.

I note that Dr. Brain accepts, in the present state of our knowledge, the hypothesis that the complaint "Meniere's syndrome," or, as I have suggested, "focal labyrinthitis," is a clinical and possibly a pathological entity—that is, a toxi-infective process in the labyrinth resulting from infection usually to be found in the nose, mouth, or throat. He examples, however, two types of case which he finds difficult to fit in with this hypothesis. In the first of these there is an interval of many years between the development of a defect in hearing and the onset of vertigo, while in the second group the attacks of vertigo are spaced at intervals of many years. I agree that such cases occur, and I have several examples in my records. I feel, however, that they will be found to slip into place in the picture provided one accepts the idea that the labyrinthine lesion is a purely secondary

one waxing or waning in accordance with the degree of toxaemia produced by the primary infection I believe that a similar picture can be seen sometimes in the case of the secondary toxi infective changes observed in such conditions as fibrositis or perhaps as presenting a closer analogy iridocyclitis in the case of the eye It it be accepted, as seems probable that the secondary tissue changes are due to circulating toxins and not to the presence of micro organisms such a state of affairs is what one would expect to accompany the accentuation or diminution of the primary infection

I should also like to stress the observation that in the majority of cases (in my last series of seventy four in two thirds) the labyrinthine lesion started as an auditory defect—that is with deafness or tinnitus—and that in this same series the average interval before the onset of vertigo was no less than 7 3 years While this observation does not agree with Dr Brain s statement that in such cases the interval between the auditory symptoms and the onset of vertigo is usually short (tinnitus and deafness precede vertigo by only a few months or at most a year or two) I believe that I am not mistaken but that the discrepancy is to be explained by the fact that while I as an otologist have inquired particularly as to the earliest onset of auditory symptoms Dr Brain s attention as a neurologist has perhaps been rather more concentrated on the vertiginous symptoms The finding that this series of cases also provides—that the time intervals are more or less uniformly spaced over the series from the shortest to the longest—suggests that there is no fundamental distinction between them

Finally since the majority of cases of Menieres syndrome start with a derangement of hearing it is important to recognize and treat such cases in this stage before irreparable labyrinthine damage has been produced I am endeavouring at the moment to define the clinical picture of such a type of nerve deafness and feel that the attempt is likely to be a successful one —I am, etc

Bristol Sept 19 A J WRIGHT

Catarrhal Jaundice

SIR —Dr C E Lakin in his article on toxic and infective jaundice (*Journal* August 27 p 437) discusses the question whether catarrhal jaundice is obstructive or toxic, and finds the reports and observations so conflicting that he considers dividing catarrhal jaundice into two classes In this discussion the data obtained by means of the hippuric acid test for liver function (Quick A J, *Amer J med Sci* 1933, **185** 630 and *Arch int Med* 1936, **57** 544) are interesting and I believe, significant It has been consistently found that the synthesis of hippuric acid is impaired in catarrhal jaundice and that the test becomes normal when the patient has completely recovered Frequently a marked impairment of the liver as determined by the hippuric acid test will still be found after the jaundice has cleared which indicates that hepatic recovery cannot be judged solely by the icterus In toxic hepatitis the test is low and corresponds well quantitatively with the clinical condition of the patient From these findings it appears that in catarrhal jaundice liver injury exists —I am etc

ARMAND J QUICK

Marquette University Medical School
Milwaukee Wisconsin Sept 10

SIR —From the discussion on jaundice at the Plymouth meeting and also from the annotation in the *Journal* of September 10 (p 581) it appears that there is still room for doubt as to whether two types of catarrhal jaundice exist and that anyhow it is almost impossible to distinguish between them This being so it may be worth while mentioning a clinical observation I made in a recent epidemic which seems as if it might be of help in this connexion

The epidemic which began here about fifteen months ago was of a mild type but it must have affected a large proportion of the children in the area between the ages of 9 and 2 in fact in one class of thirty seven children no fewer than fifteen were absent because of it when the school opened in August The most remarkable difference from the usual clinical description was that only once was I able to palpate the liver and that with difficulty while the spleen was never palpable at all All the cases except one while the epidemic was in full swing were of the same type The exception was a girl of 12 (almost the oldest child I saw with jaundice) and her condition corresponded exactly with the usual type of non epidemic catarrhal jaundice—less acute onset longer-lasting jaundice and liver enlarged to three fingerbreadths below the costal margin This case proved most instructive

Ever since Mr D Ligat (*Lancet* 1919 **1** 729) published his account of what is now known as Ligat s reflex—the elicitation of hyperaesthesia of the abdominal wall by gentle pinching of the skin—I have been interested in the areas of hyperaesthesia discovered and have found the sign of great practical value as well as—in measles—of some theoretical interest (*Journal* 1935 **2** 84) (With reference to this earlier observation of mine it may be of interest to mention that the pathology of the appendix in measles has been studied in Germany and that at least one case is on record in America in which an appendix was removed at operation and from it the pathologist gave the correct diagnosis of measles before the rash appeared) I naturally tested for this reflex on these cases of jaundice as I should in any case of vomiting and was not surprised to find it in the appendicular area of every case that had not had the appendix removed I found also that the reflex was active on the opposite side of the mid line which is not unusual in cases of appendicitis However with numbers of cases passing through my hands I noticed that the left sided reflex had a most unusual and exact distribution It began at the level of the umbilicus about half way between the linea alba and the linea semilunaris and it descended vertically nearly half way to Poupart s ligament Very seldom did it rise above the level of the umbilicus and it was definitely a line about ½ to ¾ inch wide and not an oval or circular area I have examined hundreds of abdomens both before and since but I cannot recall ever having found a Ligat s reflex with such a distribution in any but a case of epidemic jaundice In the case of ordinary catarrhal jaundice which I have mentioned both the appendicular and the left sided reflex were significantly absent

Since the epidemic died down I have had several opportunities of seeing sporadic cases of sickness and in the few cases in which this new reflex was present jaundice was either actually present or appeared subsequently One particularly interesting case was a child of 12 whom I saw late one night with a temperature of 102 F and a bilious attack I knew she had a mild chronic appendicitis but this time the new reflex was present also A specimen of urine proved to contain a slight trace of bile and next morning there was an icteric conjunctival tinge In forty eight hours the bile had disappeared from the urine the reflex had gone also and the girl was practically well again I have seen one adult male with the typical symptoms and the two reflexes and fourteen days after I first examined him I saw his sister aged 26 with both reflexes present and she also became a typical case of epidemic jaundice

It these observations are confirmed by the experience of other investigators in other epidemics it would appear that we have here a simple clinical sign which will definitely distinguish between two types of catarrhal jaundice indeed a sign which is probably pathognomonic for the epidemic variety If this is so it should materially aid the investigation of the epidemiology of the disease and

lead to distinguishing as such what might otherwise pass as more or less ordinary 'bilious attacks,' as in the girl I have just mentioned. I do not know what abdominal organ this very circumscribed reflex refers to, but it is clear that its presence does denote an inflammation of some organ which is a constant feature of the disease. In view of the paucity of pathological reports on epidemic jaundice this observation seems of some importance. It is impossible for one observer to be dogmatic about any point, but I think that the left-sided reflex probably develops before the appendicular one and usually disappears before it. It is seldom found for more than a week or so after the jaundice develops. In testing for this reflex I should like to stress that the greatest care and gentleness are necessary. It is easy to get a child into such a condition that no observation is possible, but patience care and a little skill will nearly always enable one to decide definitely on its presence or absence, and in view of the child's known vagueness as to abdominal pain it is astonishing how accurate the localization of the reflex is.—I am, etc.,

Winsford, Cheshire, Sept. 17 W. N. LEAK, M.D.

The Harris Prostatectomy

SIR,—It is but natural that Messrs. Colin Edwards and Richard G. S. Harris of Sydney, New South Wales, should desire to defend the Harry Harris technique for prostatectomy, but I am not aware that Mr. Kenneth Walker has ever attacked it or my modification of it. The operation of reconstruction for the adenomatous prostate will never be successfully assailed, even by transurethral resection, until the surgeon has to exchange his scalpel for a hormone.

Mr. Kenneth Walker has pointed out that pelvic cellulitis is a complication of the Harris technique. This may occur in any case of suprapubic cystotomy, and is no more common in a prostatectomy efficiently carried out than in other bladder operations which require an exposure of the pre-vesical space.—I am, etc.,

London, W.1, Sept. 19 CLIFFORD MORSON.

Faecal Accumulation in the Rectum

SIR,—The article by Mr. Harold Dodd (*Journal*, September 17, p. 624) calls to mind the instructions I received when attending the surgical class of Mr. John Duncan in Edinburgh in the early 1880's. His suggestion for the removal of the impacted mass in the rectum was to aid the finger with "the handle of a tablespoon." On more than one occasion I have been called to attend patients suffering from 'diarrhoea" when examination of the rectum has revealed a large faecal mass. The satisfaction at so ready a discovery of the cause and so obvious a method of treatment—with or without the tablespoon—remains in the memory.—I am, etc.,

W. W. SHRUBSHALL, D.P.H.

Burgess Hill, Sussex, Sept. 17

SIR,—The article by Mr. H. Dodd in the *Journal* of September 17 (p. 624) reminded me of a case that came to my notice some years ago.

The lady in question, who proved to be a primipara, came in early pregnancy for confirmation of her condition. She appeared to be in good health and had no complaints. On examination I found the lumen of the vagina obstructed by a large tumour-like formation rendering passage of the examining finger impossible. The patient assured me that her bowel activity was satisfactory and added that her motions were frequent and watery. Rectal examination revealed a firm faecal mass about the size of a foetal head. I evacuated this mass digitally, leaving the rectum apparently empty. Olive oil enemata were administered later by a nurse, who reported good results. In three days' time I again examined the rectum and found another faecal mass, as firm as the first but not so large. I evacuated this mass digitally. Oil enemata were continued and three days later there was still in the rectum some hard residue which I removed. The enemata were discontinued, and liquid paraffin orally was substituted. During the remainder of her pregnancy there was no recurrence of excessive faecal accumulation.

This case stressed the importance of rectal exploration not only in pregnancy but in the wider fields of medicine, as my later experience proved.—I am, etc.,

Birmingham, Sept. 17 A. W. DOCKAR.

Peritonsillar Abscess

SIR,—I wish to refer to several points raised recently regarding peritonsillar abscess (*Journal*, June 18, p. 1323, July 2, p. 41, July 16, p. 152). It hardly seems reasonable to lay down a hard-and-fast rule as to when a peritonsillar abscess should be opened, but if a patient is in acute distress a well-judged incision will give some relief at least, and probably great relief. Much pain is inflicted on patients by the use of unsuitable instruments. It is certainly injudicious to use a 10 per cent. cocaine spray, but 10 per cent. cocaine applied about the site of incision and nowhere else will be found satisfactory. After painting with cocaine an injection of 1/2 per cent. or 1 per cent. novocain with a minute amount of adrenaline—made slowly into the tissues to be incised and allowed at least five minutes in which to act—is a great boon to the patient. The injection should be made with a very sharp, fine hypodermic needle, firmly fitted on to, say, a long, thin, glass tuberculin syringe. Finally, the knife must be extremely sharp pointed and thin—a new von Graefe's knife is perhaps best. With such a knife a well-placed incision will not give severe pain if the site of incision has been properly prepared. In competent hands it must be rare not to find pus. An ordinary scalpel seems a cruel instrument with which to open such a tender mass, but those who would enlarge an incision by stretching it with sinus forceps ought surely to have the operation done on themselves.—I am, etc.,

Brisbane, Australia, August 12 H. V. FOYTON.

Universities and Colleges

UNIVERSITY OF LONDON

WESTMINSTER HOSPITAL MEDICAL SCHOOL

The inaugural address at Westminster Hospital Medical School will be given by Dr. Robert Hutchison, President of the Royal College of Physicians of London, on Monday, October 3, at 3 p.m. The chair will be taken by Major H. M. Clowes, D.S.O.

LONDON (ROYAL FREE HOSPITAL) MEDICAL SCHOOL FOR WOMEN

The inaugural address of the London (Royal Free Hospital) School of Medicine for Women will be delivered by Lord Horder at the Royal Free Hospital, Gray's Inn Road, W.C.1, on Tuesday, October 4, at 3 p.m.

UNIVERSITY COLLEGE HOSPITAL MEDICAL SCHOOL

A reception will be held at University College Hospital Medical School on Tuesday, October 4. At 3.15 p.m. Sir StClair Thomson will deliver an address on "Lister at University College and Hospital."

Obituary

THOMAS MONCK BURN MURDOCH M B C M Ed F R C P Ed

Consulting Physician Royal Edinburgh Hospital for Sick Children

We regret to announce the death on September 13, after a brief illness of Thomas Monck Burn Murdoch Born in Edinburgh in 1854 the second son of John Burn-Murdoch, Advocate of Gartincaber Doune he was educated at Begbies and the Collegiate Schools He then passed to the University of Edinburgh to study medicine, where he was the pupil of Joseph Lister then Regius Professor of Clinical Surgery this association he often referred to with great pleasure and pride After graduating in 1877 Dr Burn Murdoch was appointed house surgeon in the Old Royal Infirmary to Patrick Heron Watson—later Sir Patrick—and subsequently held a second appointment under the same chief at Chalmers Hospital where he had charge of both medical and surgical patients an experience which proved invaluable to him in his future career as a general practitioner In 1879 Dr Burn Murdoch began practice in the Morningside district of Edinburgh but in the later years of his professional life he lived in Charlotte Square He early gained the confidence and esteem of the public and built up an extensive practice in the city, and his advice was also frequently sought as a consultant As a general practitioner he possessed a sound and thorough knowledge of his profession and keen powers of observation Many a young practitioner has owed his start in his profession and his subsequent success to his kindly help and advice

In 1883 Dr Burn Murdoch became extra physician to the Royal Edinburgh Hospital for Sick Children and physician in 1899 retiring in 1906 he thus gave twenty-three years of useful and loyal service to that institution While on the staff of the hospital he was lecturer in the diseases of children in the University His long association with this hospital stimulated his interest in the health and physical welfare of children and among his other appointments he held that of physician to the Ministers Daughters College for twenty four years and for twenty-eight years that of medical officer to Merchiston Castle School His methods were far ahead of his times and achieved outstanding success In 1898 he was a vice president of the Section of Diseases of Children at the Annual Meeting of the British Medical Association

On the outbreak of the war he gave up much of his time to war work In January 1916 unable to resist the clamant need for doctors he offered his services to his country and was asked to organize the Smithson War Hospital at Greenock where he held the rank of honorary major in the R A M C Later he took command of the Springburn-Woodside Central Hospital Glasgow with its auxiliary establishments and in 1918 became medical officer to Dalmeny House Hospital in which he remained to the end of the war If after the war he could have returned to Edinburgh as a consultant physician for children s diseases he would doubtless have fulfilled his personal desire On the death however of his elder brother in October, 1914, Dr Burn Murdoch had inherited the family property of Gartincaber and regarding it as his duty to accept the responsibilities of a resident laird he reluctantly gave up his professional work to the great regret of his many patients and professional friends

Spare of figure athletic in build and brought up with facilities for outdoor life he developed a fondness for games and always kept himself physically fit It is related that on one occasion he walked in one day from Edinburgh to Gartincaber a distance of forty seven miles thus repeating the remarkable feat previously performed by his father As a student he regularly played Rugby football, gaining his place in the University XV as a three-quarter back As a sprinter he won many events at athletic sports He was the first to introduce into Scotland the method of running between strings and he himself pegged out the lines when they were first employed in the University sports He took an active part in the efforts which were made to secure the athletic field at Craiglockhart The motto of his life was thoroughness, and in all that he attempted he never failed to keep this principle prominently before him

In 1880 he married his cousin Miss A R de Maule Urmston who as his devoted partner for fifty seven years untiringly assisted and encouraged him in his daily work She predeceased him by a few months

KENNETH HAROLD WATKINS M S F R C S

We announce with regret the death after a motor accident in Germany of Mr Kenneth Harold Watkins of Manchester at the age of 34 Kenneth Watkins was the son of Dr H E Watkins medical officer of health for Newton-in-Makerfield Lancashire He began his medical career at the Manchester University Medical School and continued it later at St Thomas s Hospital and in Freiburg He was awarded the Bradley Memorial Scholarship in clinical surgery while still a student in 1926 and a prize in clinical medicine in 1927 when he qualified M B Ch B with second class honours In the same year he took with honours the M B B S of London proceeding to the London degree of M S in 1931 a year after he had obtained the F R C S He had acted as a house surgeon and later as the assistant resident surgical officer of the Manchester Royal Infirmary as house-surgeon of the genito urinary department of the Salford Royal Hospital, and he had been registrar and medical officer of the Christie Hospital In 1932 he was attached to the Brady Urological Institute of the Johns Hopkins Hospital at Baltimore as a Rockefeller Fellow and in 1933 he was one of the Hunterian professors of surgery of the Royal College of Surgeons

On his return to Manchester after twelve months in the United States he specialized in urological surgery and became honorary surgeon for genito urinary diseases to the Manchester Northern Hospital and to the Christie Hospital holding at the same time the post of urological assistant at the Royal Infirmary Manchester In recent years he had contributed several articles to the special surgical and urological journals perhaps the last of them being a paper written in collaboration with Dr Fergus R Ferguson on paralysis of the bladder and associated neurological sequelae of spinal anaesthesia which appeared in the April issue of the *British Journal of Surgery* Kenneth Watkins was recognized as one of the most outstanding of the younger surgeons in Manchester His academic career had been a brilliant one and there seemed no doubt that the same degree of distinction would attend his specialized work in later life His tragic death at the early age of 34 will be deeply regretted by all his colleagues in Manchester and particularly by those who have been associated with him in his work at the Royal Infirmary A memorial service was held at the chapel of the Manchester Royal Infirmary on Tuesday

Mr J B Macalpine writes

The tragic news of the death of Kenneth Watkins comes as a bitter blow to Manchester medical and surgical circles, where Watkins was greatly esteemed and loved It must be long since medicine in this city has had to mourn one for whom the future seemed more bright—even though he was as yet scarcely beyond the threshold of success—or has lost a man who, while relatively young, will be more difficult to replace It was in 1930 that Watkins became my house-surgeon in the urological department of the Salford Royal Hospital, and it was here that I first learned his sterling qualities, his industry and helpfulness, his intelligent handling of his cases, his cheerful acquiescence when called upon to do things lying outside his scheduled duties From then onwards I had followed his career with interest, and perhaps some pride After leaving me he was successful in obtaining the Rockefeller Fellowship which gave him a year in the well-known urological service at the Johns Hopkins Hospital and there his innate energy and enthusiasm enabled him to extract the fullest possible value from the rich opportunities at his disposal During his stay in America he also visited other important clinics in that country Watkins then planned a trip to certain German urological departments, and passed approximately three months on the Continent It was during this visit that he met the lady whom he subsequently married Returning home, Watkins spent a year doing routine general surgery as resident surgical officer to the Manchester Royal Infirmary before finally devoting his whole time to urology On leaving the Infirmary he quickly obtained a number of hospital appointments At the Northern Hospital and at the hospital at Crumpsall he organized urological units, while at the Radium Institute, as registrar and medical officer, he was fortunate in being able to observe closely the irradiation of growths of the urinary tract Watkins selected his life's specialty early, and having done so he pursued his objective unswervingly with exemplary consistency and zest It seems hard that so much forethought and preparation should be wrecked just when they were maturing and becoming available to humanity Wherever he was known it was recognized that Watkins was a man marked out for advancement, and indeed, much of the hope of Manchester surgery lay with him He was universally admired, respected, and beloved He spoke ill of none and none spoke ill of him He made no enemies but many friends His tall lithe figure his cheery laugh, and his thoughtful, purposeful but happy mind will be sadly missed He leaves a widow and two small children, to whom we extend our sincere sympathy

"T M another colleague of his, writes

The profession in Manchester has been shocked by the untimely death of Kenneth Watkins He was a very gifted young surgeon and his skill in his special branch was unsurpassed Greatly as we admired him professionally however, it was as a man we valued him most I was fortunate, coming as a stranger to Manchester eighteen months ago, to be his successor No man could have had a truer friend The kindness he bestowed upon me is beyond description He was always ready to teach specialized urological procedures, and the debt I owe to him can never be expressed During my constant association with him I have never heard him say an ill word of anyone He was completely devoid of malice The very high esteem in which he was held by his colleagues and patients reciprocated in very small part the kindness and consideration he had for his fellows Endowed with all virtues his was a character of the very rarest quality

MR A J STORY

With the death on September 11 of Mr Arthur John Story the deaf have lost a friend and one of their most indefatigable workers The Blind and Deaf Act of 1893 made the education of deaf children compulsory, and the duty of providing suitable education was placed upon the local school boards In 1896 Mr Story became head master of the first residential school to be established under the new Act He continued in this post until 1923, and in 1925 became secretary of the National Institute for the Deaf He was a member of the Council of the Royal Society of Teachers from 1910 to 1925, and chairman of the National College of Teachers of the Deaf in 1910–11 and 1920–21, and served as lecturer and examiner on speech and language to the college He edited *The Teacher of the Deaf* for twenty-one years Since his retirement from the position of head master of the Blind and Deaf School at Stoke on-Trent the whole of his activities have been devoted to establishing the National Institute for the Deaf His one thought seemed to be his work He had no hobbies and no recreations After a day's routine at the Institute he would go home, sink into his chair, and continue in one form or another the work which was so dear to his heart For some years he made a habit of doing a crossword puzzle daily, and apart from this small diversion and reading the daily news his whole thought was given over to his work

As secretary—the first and only secretary so far—to the National Institute for the Deaf he was excellent Having played the dominant part in the formation and development of this institution he was complete master of all details and matters connected therewith, which covered a very wide field He will therefore be a very difficult man to follow, and it can be said that there is no one more knowledgable than he was in the matters with which the Institute has to deal

Under a careless and unkempt exterior there existed a gentle, generous, and soft hearted nature, always ready and willing to give help to anyone requiring and seeking it, not only in the form of advice in any difficulty, but also help of a more material nature A serious man with a keen sense of humour and a good knowledge of men, he was highly successful in the management of his committees—not always an easy task—and he had the respect, affection, and good will of all His loss will be deplored by all who knew him, for he made many friends and few, if any, enemies

THE LATE SIR ROBERT WOODS

Dr H C Drury writes Having known Sir Robert Woods intimately since his student days, through the whole of his professional life, I would like to add something to the bare announcement of his death He looked so strong and so young that it was a severe shock to read in our morning paper that he had left us

One remembers him as a student dissecting over and over again everything connected with the larynx This he made the specialty of his practice in after life, and with what wonderful success we in Ireland know Perhaps few if any surgeons had such a record as his in the removal of the entire larynx for malignant disease Not content with operation, he trained his patients afterwards so that they could live for years in comfort with a certain intelligible voice Skill and thoroughness were the outstanding characteristics of his work, leaving nothing to chance His amazing vitality and conscientiousness enabled him to get through an enormous amount of work His fame increased the number of his patients, so that hospital kept him, on his dispensary days, steadily at work there from 10 a m till after 1 o clock, for he gave to the poor just

as great patience and care as he gave to the more well-to do He was so skilful in his workshop that he made many adaptations of his instruments and appliances His house was a charm everything in it was a delight to one with any appreciation of art As a host he was just Robert Woods—no side, a hearty cheerful welcome and the best of everything

Dr JOHN CORCORAN of Worcester Park Surrey died on August 26 following an operation in a London nursing home John Corcoran was the youngest son of Mr Patrick Corcoran of Ballinadee Bandon Co Cork He qualified L R C P, L R C S Ed L R F P S Glas in 1914 through the old Queen's College Cork—now a constituent college of the National University of Ireland—and the Edinburgh Medical School He first practised in Ireland and was house surgeon at the Mercy Hospital Cork In 1916 he joined the Royal Army Medical Corps with which he served in Ireland and India After the war he entered into practice in Sutton Surrey and also held several hospital appointments in London As the senior member of a partnership in one of the most populous and rapidly growing residential areas of outer London he brought to his professional work skill, experience and the qualities of earnestness and enthusiasm He loved his work for its own sake and his thorough and painstaking methods inspired confidence in his patients and respect from his colleagues In addition to the exacting duties of his general practice he acted as honorary anaesthetist and physician to St Anthony's Hospital Cheam Dr Corcoran upheld the highest traditions of the profession and his characteristic Irish *bonhomie* and charm of manner made him a general favourite It is safe to say that there was no more popular doctor in the district where he lived and worked with such benefit to the community for close on twenty years His loss will be sincerely regretted by his colleagues and particularly by those associated with the work of the Surrey Panel Committee of which he was a member Though professional interests dominated his life he was a keen sportsman and was particularly devoted to shooting and golf in such intervals of leisure as the exigencies of a strenuous working career permitted He had been a member of the British Medical Association since 1923 and he took an active part in the London Irish Medical Golf Society

The following well known foreign medical men have recently died Dr DOMENICO TADDEI professor of clinical surgery in the University of Florence author of textbooks on surgical diagnosis and pathology and editor of *La Clinica Chirurgica* and co editor of *Rassegna internazionale de clinica e terapia* Professor ALFRED LUGER an eminent physician of Vienna aged 58 and Lieutenant-General CARLO GUALDI of Naples formerly inspector of health for Southern Italy, aged 76

LONDON HOSPITALS AND AIR RAIDS

In June the Ministry of Health took over from the Home Office the hospital side of air raid precautions The Ministry has accordingly assumed the responsibility and in consultation with the London County Council and the voluntary hospitals made arrangements for organizing all kinds of hospital accommodation in London (including casualty clearing as well as base hospitals) which might be required for the treatment of civilian air raid casualties To assist in this work the Council has temporarily seconded for work at the Ministry one of its senior medical officers who is acting as hospital officer for the London district and working out detailed plans for the various hospitals In addition the Council has purchased on behalf of the Ministry a large amount of extra equipment and is co operating in every possible way subject to the general advice and direction of the Ministry

Medical News

The Chairman of Council Sir Kaye Le Fleming and Dr J W Bone have been returned unopposed as Direct Representatives of the profession in England and Wales upon the General Medical Council for a period of five years from November 1 1938 Sir Kaye Le Fleming and Dr Bone were selected by the Divisions in England and Wales to receive the support of the British Medical Association

The annual dinner of the Middlesex Hospital Medical School will take place at the Savoy Hotel on Friday September 30 at 7 30 p m with Dr G E S Ward in the chair

The annual dinner of past and present students of University College Hospital Medical School will be held in the library of the medical school University Street W C 1 on Friday October 7 at 7 30 p m with Dr F Clayton in the chair Applications for tickets (price 12s 6d exclusive of wine) accompanied by remittance should be made not later than October 6 to the dinner secretary

The annual dinner of University College Hospital Medical Women's Association will be held at the Langham Hotel Portland Place W 1 on Friday October 7 at 8 p m with the president Miss Gwendoline Smith in the chair Tickets are priced 10s 6d each (exclusive of wine) and members intending to be present should notify the secretary Dr A. L Winner 41 Devonshire Street W 1 not later than October 4

The West London Medico-Chirurgical Society will hold a dinner meeting at the De Vere Hotel Kensington W 9 on Friday October 7 at 7 45 p m The presidential address will be given by Dr Maurice Shaw on Heredity and Medicine at 8 30 p m

The eighth annual dinner of the British College of Obstetricians and Gynaecologists will be held at Claridge's Brook Street W 1 on Friday October 28 at 8 p m The official guests will be Dr Robert Hutchison and Mr Hugh Lett

The annual prize distribution of Charing Cross Hospital Medical School will be held at the hospital on Friday September 30 at 4 p m

The sixth Congress of the Italian Society of Plastic and Aesthetic Surgery will be held in the Policlinico Umberto I Rome next October when the chief subject for discussion will be facial trauma in war surgery Further information can be obtained from Professor Riccardo Galeazzi Via Sistina 4 Rome

The Congress of the German Orthopaedic Society will be held at Giessen from October 3 to 5 under the presidency of Professor Putzler

The sixty second international postgraduate training course of the Vienna Medical Faculty will be held from September 26 to October 8 and the full programme can be obtained from the office of the Vienna Medical Faculty Allgem Krankenhaus Alserstrasse 4 Vienna IX.

A meeting of the Royal Sanitary Institute arranged in conjunction with the Welsh Branch of the Society of Medical Officers of Health and the North Wales Centre of the Sanitary Inspectors Association will be held at the Guildhall Wrexham on Friday September 30 at 5 p.m when discussions will take place on Physical Fitness in Relation to Public Health to be opened by Dr T P Edwards and The Food and Drugs Act, 1938 to be opened by Mr D Thomas Dr Charles Porter will be in the chair

The University of Glasgow announce the opening of the Gardiner Institute of Medicine by Lady Gardiner on Wednesday September 28 at 4 30 p m. when the Right Hon John Colville will give an address

The King has appointed Dr George Leslie Milburn to be a Member of the Executive Council of the Presidency of Saint Christopher and Nevis

INFECTIOUS DISEASES AND VITAL STATISTICS

We print below a summary of Infectious Diseases and Vital Statistics in the British Isles during the week ended September 10, 1938

Figures of Principal Notifiable Diseases for the week and those for the corresponding week last year, for (a) England and Wales (London included) (b) London (administrative county) (c) Scotland (d) Eire (e) Northern Ireland Median values for the last 9 years for (a) and (b)

Figures of Births and Deaths, and of Deaths recorded under each infectious disease, are for (a) The 126 great towns (124 in 1937) in England and Wales (including London) (b) London (administrative county) (c) The 16 principal towns in Scotland (d) The 13 principal towns in Eire (e) The 10 principal towns in Northern Ireland

A dash — denotes no cases, a blank space denotes disease not notifiable or no return available

Disease	1938					1937 (Corresponding Week)					1929-37 (Median Value Corresponding Weeks)

EPIDEMIOLOGICAL NOTES*

Acute Poliomyelitis

In England and Wales 73 cases of acute poliomyelitis were notified during the week under review the same as in the previous week while for London the figure of 6 showed an increase of one over last week Notifications of two or more cases were received from Braintree and Bocking (urban) 2, Church 2 East Elloe 2 Ipswich 2 Kenilworth 2 Lewisham 2 Middlesbrough 3 Reading 3 Rochdale 2 Shrewsbury 2, Swansea 2 The occurrence of 3 cases (of which one patient has died) at Middlesbrough where no cases have hitherto been notified in the present year indicates a further extension of acute poliomyelitis in the North At the time of going to press 2 further cases have been reported in this town Notifications in Scotland dropped from 14 to 13 during the week under review the chief centres being Edinburgh 4 (3) Ayr 2 (0) Glasgow 2 (3) During the week ended August 27 319 cases were notified in Germany compared with 165 cases in the previous week the districts chiefly affected were Baden 17 Bavaria 18 Cologne 89 Frankfort 13 Saxony 19 Wiesbaden 13 Wurtemburg 55 During the same week 34 cases were notified in Austria of which 11 were in Vienna During the week ended September 3 notifications in Holland rose from 54 to 67 of which 37 were in the province of South Holland (30 in the previous week) Of the 37 cases 7 occurred in the commune of Alphen and 6 each in Rotterdam and The Hague In Sweden during the first fortnight of August notifications rose from 36 to 101 (including 11 non paralytic cases) the districts chiefly affected were province of Jamtlands 49 Kristianstads Province 16

Typhoid Fever

Of the 36 cases of typhoid fever notified in England and Wales during the week in only four centres was more than one case notified—London 2 Barking 2 Farnworth 2 Southampton 2 the London cases were reported from Paddington and Hampstead (in the latter case the disease was contracted in the South of France)

Diphtheria and Scarlet Fever

There was a slight increase in the notifications of diphtheria in England and Wales and in London during the week under review—1 184 (1 130) and 146 (127) respectively The chief centres in which increases were noted are Gateshead 14 (5) Easington 18 (8) Leyton 10 (4) Walthamstow (Essex) 6 (0) Bristol 12 (7) Bolton 12 (6) Liverpool 58 (52) Leicester 15 (5) Lambeth 13 (7) Lewisham 18 (7) St Pancras 10 (3) Norwich 11 (3) Esher 5 (0) Coventry 10 (3) Leeds 13 (5) Sheffield 29 (14) Swansea 5 (2) Deaths from diphtheria fell in the 126 Great Towns from 19 to 18 during the week under review and in London from 7 to 4 A considerable rise was noted in the incidence of scarlet fever in England and Wales during the week the numbers notified being 1 625 compared with 1 391 in the previous week in London a corresponding increase was recorded—121 (97) The chief increases were in Slough 5 (0) Stockport 16 (8) Gateshead 6 (2) Ilford 9 (2) Gillingham (Kent) 6 (0) Liverpool 47 (28) Bolton 6 (0) Battersea 6 (1) Bethnal Green 5 (0) Hampstead 5 (0) Islington 11 (7) Ealing 7 (3) Tynemouth 7 (0) Croydon 6 (2) Birmingham 40 (32) Kingston upon Hull 20 (10) Leeds 32 (18) City of York 8 (4) There were 7 (1) deaths in the 126 Great Towns during the week—2 in London and 1 each in Eastbourne Portsmouth Barrow in Furness Nottingham and Stoke on Trent

Measles and Whooping cough

Five deaths from measles were recorded in the 126 Great Towns of England and Wales during the week—2 in Leeds and 1 each in Bradford Kingston upon Hull Birmingham

* Except where otherwise mentioned figures in parentheses refer to the week preceding the one under review

The average daily admissions to the LCC fever hospitals were 2 (3) In the metropolitan boroughs in which measles is notifiable the numbers rose in five—Bermondsey 4 (0) Fulham 3 (0) Hampstead 3 (0) St Pancras 6 (2) and Stepney 2 (1)—and were *nil* in Battersea and Greenwich In Scotland notifications rose from 21 to 37 during the week under review Increases were noted in Glasgow 12 (1) Dundee 6 (1) Edinburgh 4 (0) Dunfermline 3 (1) In the 126 Great Towns of England and Wales 8 (6) deaths from whooping-cough were recorded 1 each in London Kingston upon Hull Liverpool Salford Stockton on Tees Warrington Gloucester and Poole In Scotland 232 (171) cases of whooping cough were notified of which 196 (141) occurred in Glasgow and 23 (15) in Paisley and 3 deaths—2 (2) in Glasgow and 1 (0) in Paisley

Cholera

During the week ended September 10 the number of cases of cholera in Shanghai fell from 421 to 245 (120 deaths) and in Hong Kong from 19 to 12 (10 deaths) In British India the incidence of cholera declined in the Central Provinces during the week—5 486 cases and 2 361 deaths compared with 8 884 cases and 3 566 deaths in the previous week there were 452 cases and 213 deaths in Bombay (Presidency) 219 cases and 77 deaths in Madras (Presidency) 215 cases and 100 deaths in the United Provinces 32 cases and 19 deaths in the North West Frontier Province

Births and Deaths for the Second Quarter

The Registrar General's return of births deaths and marriages in the thirteen weeks ended July 2 records that 164 257 live births were registered in the second quarter of this year which is 480 more than the number registered in the second quarter of 1937 and corresponds to an annual rate of 16 1 per thousand of the estimated mid year population for 1937 The number now reported is more than 6 000 above the average figure (157 901) for the second quarter during the preceding five years Of the total 7 256 were illegitimate Male births numbered 84 166 and female births 80 091 giving a proportion of 1 051 males to 1 000 females The stillbirths registered during the quarter were 6 632—13 more than the number recorded in the second quarter of last year and corresponding to an annual rate of 39 per cent. of the total births registered

Deaths (excluding stillbirths) numbered 119 177 and were 18 749 fewer than in the preceding quarter but 652 more than in the corresponding quarter of 1937 The total deaths correspond to an annual rate of 11 7 per 1 000 of the population The mortality of infants under one year of age was equal to 48 per thousand registered live births being 9 per 1 000 below the average of the ten preceding second quarters

The highest death rates from certain epidemic diseases in the 126 Great Towns (Table V) during the quarter were as follows

From *measles* 0 57 in Barnsley 0 53 in West Hartlepool 0 41 in Bury 0 28 in Gateshead 0 26 in Kingston upon Hull and 0 24 in Gillingham from *whooping cough* 0 29 in Keighley 0 23 in Great Yarmouth 0 16 in Birmingham and 0 14 in Gateshead and in Salford from *diphtheria* 0 63 in South Shields 0 52 in Newcastle under Lyme 0 38 in Great Yarmouth 0 37 in Keighley and 0 35 in Wigan from *influenza* 0 75 in West Bromwich 0 60 in Dudley 0 57 in Hastings 0 39 in Lincoln and 0 38 in Walsall

The highest death rates per 1 000 live births from *diarrhoea and enteritis* among children under two years of age were 18 7 in Brighton 16 7 in Sunderland 13 7 in Birkenhead 13 6 in Enfield 13 3 in Newport (Mon) and 13 0 in Northampton

CORRIGENDUM

In the issue of July 2 the figures given for cholera at Shanghai and Hong Kong during the week ended June 18 were repeated erroneously under the heading "Plague", there were no cases of plague in these towns during the week in question

Letters, Notes, and Answers

All communications in regard to editorial business should be addressed to THE EDITOR BRITISH MEDICAL JOURNAL B M A HOUSE TAVISTOCK SQUARE W C 1

ORIGINAL ARTICLES and LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* alone, unless the contrary be stated Correspondents who wish notice to be taken of their communications should authenticate them with their names, not necessarily for publication

QUERIES AND ANSWERS

Cleaning Slides for Blood Films

Dr A C EVANS (Denbigh), in reply to J S M' (*Journal* August 27 p 480) writes Rub both sides and the ends of the slides well with monkey brand cake slightly wetted with water wash under tap water and dry with a clean non-starched smooth towel Then wash with alcohol and again dry flame both sides of the slides well in a Bunsen flame in order to burn away any grease After cleaning, handle the slide by the side edges and avoid touching the surfaces or ends The washing with alcohol can often be omitted Cleaning with monkey brand' is not recommended if the slides are subsequently to be used for the examination of sputa etc, for tubercle bacilli it tends to scratch the slides so that with reflected light artefacts appear

DR A C COLES (Bournemouth) also writes I have found the following by far the best method for cleaning new or used slides In the case of used slides it is necessary to remove the balsam or immersion oil with methylated spirit Then prepare a paste of pulv cretae prep whiting, and water in a clean ointment pot, rub a little of this over the surfaces of the slide with an old shaving or tooth brush, or a piece of cloth but not with the finger Wash in water and polish with an absolutely clean cloth In most cases this is all that is necessary but if one is going to prepare the slides for staining flagella—or in fact for any aqueous or saline material in which there is little or no albumin—it is advisable to smear the surface of the slides with either a piece of soap or the cut surface of a raw potato (as motorists prepare their wind screens), and then polish with a clean cloth One can easily test the result by placing a drop of water on the slide and spreading this out with the end of another slide or a needle If the water spreads evenly and remains so the slide has been cleaned satisfactorily It should be noted, however, that it is quite impossible to attain this result in a small proportion of slides probably owing to some peculiarity in the glass itself I used to clean new cover glasses by dropping them one by one into sulphuric or nitric acid or a mixture of sulphuric acid and potassium bichromate but now find that all that is necessary is to keep them in a wide mouthed bottle of methylated spirit In a paper on the staining and microscopical demonstration of filterable viruses in the *Journal of the Royal Microscopical Society* (1935 55 249) I have fully described the methods of cleaning slides etc and an easy method of packing films for postage which displaces that abomination—the racked microscopical slide box

Income Tax

Sale of General Practice—Book Debts

"A's practice consisted up to December 31, 1937, of several public appointments eye specialist work, and a general practice The last-mentioned was sold as from that date and the outstanding book debts were sold with it, say a nominal amount of £x debts for £y in cash A's professional accounts were made on a cash basis up to December 31 yearly, but for convenience and thinking it more correct he proposes that the first account for the reduced practice shall be made up as for the year to April 5 1939, ignoring the quarter to April 5, 1938 The inspector of taxes claims to include in the account for the year to December 31, 1937, the £x received on sale of the practice and requires an account for the subsequent period which shall include the quarter to April 5, 1938

*** In our view there is no liability on "A" to bring in the £x as income of the year 1937, or indeed of any other period In dealing with questions arising on cash accounts it is important to remember that in the early years of a practice the Revenue will not accept the cash basis, holding quite correctly that it is only after three or four years that the amount of the cash receipts is a fair index of the gross income of the practice They therefore claim in such circumstances to bring in any increase in the value of the book debts to raise the cash receipts to the correct amount The obvious corollary is that in the final year of a practice the cash receipts are an adequate measure of the gross income and if the value of the book debts at the end of proprietorship be added, the result must be to inflate the gross income unduly Or looking at the same point from a different angle, if the realized value of the book debts at December 31 1937 be included as professional receipts then the corresponding value of the debts as at December 31 1936, must be deducted If the inspector of taxes adheres to his contention our correspondent would be well advised to place the facts before the Secretary, the Board of Inland Revenue Somerset House W C 2 and ask for an official ruling on the matter With regard to the subsequent account, it really seems to make little difference whether an account is prepared for the year to December 31 1938, or for the fifteen months to March 31 1939—in which case the assessment would be on one fifth of the result for the quarter to April 5, 1938 and on four fifths for the year to April 5, 1939 But an account covering the quarter to March 31, 1937, will be necessary either as a separate account or as part of an account for a longer period "A" should of course see that the assessment for the year to April 5, 1938, is reduced by excluding the "general' practice as for the last quarter of that year

LETTERS, NOTES, ETC.

Uterine Swabs in Puerperal Pyrexia

Dr C S THOMSON jun, writes from the Royal Maternity Hospital, Belfast It was surprising to read in Dr R M Fry's article in the *Journal* of August 13, page 342, that preliminary cervical and intra uterine swabs are unnecessary in the diagnosis of puerperal pyrexia The finding of streptococci in a vaginal swab will surely necessitate further uterine ones, both for purposes of prognosis and for medico legal protection Again without uterine swabs, how may we be sure that *B coli* staphylococci, etc are not being found merely as vaginal commensals? In view of the extra time danger and expense of a second bacteriological investigation one must question this advocacy of the preliminary vaginal swab

Effect of Oestrogens on Ovum

Dr LOUISE E FRASER (Aberdeen) writes It is comfortably assumed by most people that a spermatozoon which escapes a spermaticide will produce a healthy foetus on uniting with a healthy ovum Whether this assumption is correct has not I think, been definitely proved Within the next two years however we are likely to have an easily administered abortifacient of some form of oestrogen which will act directly on the ovum What is likely to be the result of a sub-lethal dose on a foetus? It will surely be interesting to investigate this point on rabbits and rats, and to compare the nutrition of mature or premature but viable young from treated animals with the young of untreated animals

Important Advance in Treatment of Human and Animal Helminthic Diseases—A Hagena

Erythema Multiforme—When this condition is associated with lesions of the buccal mucous membrane it is apt to be mistaken for human foot and mouth disease especially when the patient comes from an infected area If the plantar aspect of the metatarsal in a guinea pig is inoculated with the contents of a suspected blister foot and mouth disease develops within

twenty four to forty eight hours in the latter condition the test is of course negative in erythema multiforme The administration of large doses of *l* ascorbic acid for three days —200 mg intravenously and 100 mg intramuscularly daily— followed for three days by 6 grains of aspirin thrice daily, produced a rapid cure in five of Hagemann's cases of erythema multiforme

Paris vol 46 July 6 1938

*Non pulmonary Form of Haemoptysis Tracheal Haemorrhage —V Cordier and P L Mounier Kuhn
*Radial Palsy after Serum Therapy —C Angelesco A N Popovici and I Balutza

Tracheal Haemorrhage —The authors point out the importance of diagnosing this condition not so much from the point of view of treatment, which is on the whole somewhat unsatisfactory, but in order to avoid labelling and treating these cases as though they were tuberculous

Serum Palsy —The authors describe an unusual case (believed to be the fifth in the literature) of a man of 25 who sustained an open fracture of the right leg He was given anti tetanic serum and anti gas gangrene serum He subsequently developed a radial palsy of the left arm with marked wasting, but without pain or sensory disturbances He recovered in seven months after massage, active movements and strychnine injections

*Pulmonary Digraphy Radiographic Method for Observation of Organs in Motion applied to Study of Respiratory Movements —G Pollitzer
Treatment of Congenital Coxa Vara —F Pouzet

Migration of Bullet —The authors describe what is believed to be a unique case of a man who after several ineffectual attempts at suicide fired a revolver at point-blank range under his chin Not only did he not damage any important structures but he is now in much better health than he was before The bullet which had stopped short of the under surface of the left parietal bone, migrated in just over six weeks from its original site to a position in the spinal canal level with the first sacral vertebra A series of radiographs is included showing various stages in the bullet's journey

Digraphy —G Pollitzer describes an ingenious apparatus by means of which two views can be taken on the same film —for example showing the lungs in expiration and inspiration These may subsequently be viewed in such a way as to produce a cinematographic effect and reproduce the appearance of the respiratory movements

Anterior Pituitary Gland in Tumour bearing Rats—J Heiman
Culpability for Delay in Treatment of Cancer—G T Pack and J S Gallo

Delay in Treatment of Cancer—An analysis of 1 000 cases taken at random from the records of the Memorial Hospital New York and the Paterson General Hospital New Jersey was made to determine the responsibility for undue delay in the treatment of cancer A doctor was consulted sooner or later by 940 patients and was blamed for the delay in 350 of them Wrong treatment was given to 161 and no treatment and no advice to 104 the remaining errors were wrong advice tardy diagnosis and delayed treatment The patients who received neither advice nor treatment were least harmed since they usually went elsewhere The causes and results of delayed treatment are analysed in detail and it is concluded that campaigns to educate the public should be accompanied by efforts to train practitioners in early diagnosis

American Journal of Diseases of Children

Chicago vol 55 June 1938

Hypochromic Anaemia of Infants Comparison of Efficacy of Ferric and Ferrous Iron—R Stephenson
Addition of Vegetable Soup and Strained Vegetables to Diet of Artificially Fed Infants—M W Poole B M Hamil T B Cooley and I G May
Insensible Perspiration in Children IV Influence of Salt—G J Ginandes and A Topper
Zinc Sulphate and Experimental Poliomyelitis Effect of Nasal Sprays after Intravenous Injection of Virus—J A Toomey and W S Tillett
Hypothyroidism as Cause of Disease of Hip—B Benjamin and P R Miller
Urinary Output of Vitamin C of Normal and of Sick Children with Laboratory Test for its Estimation—T S Bumbalo
One hour Two-dose Dextrose Tolerance Test.—M Cooperstock and J M Galloway
Growth Norms from Birth to Age of 5 Years Study of Children reared with Optimal Paediatric and Home Care—J G Peatman and R A Higgons
Evidences of Disturbed Prenatal and Neo-natal Growth in Bones of Infants aged 1 Month—L W Sontag
Protection Phenomenon in Measles Debyes Phenomenon or Auspharmomen—W R Phillips
Poliomyelitis Antiserum obtained from Horses II Neutralizing Effect against Various Strains of Virus—J A Toomey

Anaemia in Infants—The author finds that ferrous iron produces a maximum effect with much smaller doses than ferric iron and that it causes no gastro intestinal disturbance Supplementary iron appears to be needed up to the age of 2 years to maintain the haemoglobin at the normal level

American Journal of Ophthalmology

Missouri vol 21 July 1938

Agent of Endophthalmitis—J S Friedenwald and C W McKee
Effects of Sulphanilamide on Rabbits Eyes—V C Rambo
Irradiation of Eye—M Cutler H L Jaffe and G Grossman
Water Content and Solids of Human Lens—P W Sallit
Sulphanilamide in Gonorrhoeal Ophthalmia—L J and R Fernandez
Retinal Changes in Hypertensive Toxaemia of Pregnancy—J F Schultz and C S O Brien
Contact Lenses—F Nelson
Removal of Large Foreign Body from Vitreous—C Rainey
Cyanosis Retinae—T M Shapira
Stereoscopic Cards in Colour for Children—C Berens

Gonorrhoeal Ophthalmia—Sulphanilamide is very successful in treatment where the disease does not follow a genital

infection The authors used it with and without local treatment the results being the same in all cases, and recovery was complete in less than the usual time

Annales de Dermatologie et de Syphiligraphie

Paris vol 9 July 1938

Angiomata Evolutionary Tumours —A Tournine and Duperrat
Experimental Researches into Alteration of Cutaneous Reactivity in Course of Repeated Irritation of Skin —L Torok

Annales d'Oto-laryngologie

Paris vol 8 May 1938

Osteoma of Fronto ethmoido maxillary Region —van den Wildenberg
*Relations between Mikulicz's Disease and Various Forms of Subacute and Chronic Parotitis —H Proby
Sign of Induration of Cerebral Substance in Diagnosis of Brain Abscess —J Piquet
Two Important Signs of Cerebellar Syndrome in Diagnosis of Cerebellar Abscess Speech Disturbances and Ocular Paralyses —H de Stella

Mikulicz's Disease and Parotitis —The author attempts to explain why parotitis, Mikulicz's disease, and other forms of inflammations of the salivary glands are usually bilateral Septic teeth appear to be the most important factor in the aetiology When the general health is impaired secretion of saliva becomes diminished and invasion of the salivary ducts by micro organisms from the mouth cavity is possible Under such conditions a bilateral invasion may be expected In certain abdominal conditions—for example, gastric ulcer—the strict dieting almost suppresses salivary secretion and bilateral parotitis may occur

Annals of Otology, Rhinology, and Laryngology

St Louis vol 47 June 1938

Base of Skull with Particular Reference to Fractures —W J Mellinger
Treatment of Tuberculosis of Trachea and Bronchi —J D Kerhan
Mixed Tumours of Hard Palate —F T Hill

Calcium Cevitamate in Treatment of Acute Rhinitis —S L Ruskin
Malignancies of Nose and Throat —R C Martin
Virus of Vocal Cord —J M Robb
Prolonged Post operative Anaesthesia in Tonsillectomy —A F Laszlo and R F Hauck
Studies on Intracranial Preventive Treatment of Poliomyelitis —M C Myerson

Bronchiectasis and Sinus Infection —The author's statistical investigation shows that there is a high incidence of sinus infection in patients with bronchiectasis But bronchiectasis cannot be attributed solely to a preceding upper respiratory infection, other diseases can be the cause, pneumonia being the most important Once a patient has acquired a chronic sinusitis the chance of further damage to the lung is increased

Herniations of Brain —The author gives a summary of the theories which have been advanced to explain the occurrence of encephaloceles, and briefly reviews twenty previously reported cases He then describes the case of a baby aged 2 with an anterior naso ethmoidal encephalocele that was successfully dealt with by operation Although there was a free flow of cerebrospinal fluid after removal of the tumour the flow persisting for eighteen days, meningitis was avoided

Archiv fur Ophthalmologie

Berlin vol 138 1938 Heft 6

Portraits of Albrecht von Graefe —R Greeff
Fibroma of Sclera —J Schmidt
*Culture Experiments with Viruses of Trachoma and Paratrachoma —I Jahn and F A Hamburger
Colour Changes of Cornea in Jaundice —J Bock
*Calcification and Thrombosis of Internal Carotid Artery as Cause of Ocular Symptoms —P Siegert
Nerve Supply of Ciliary Body —H Krümmel
Correlation of Hereditary Ocular Lesions —A Catsch
Present Position as regards measuring Blood Pressure in Intraocular Arteries —H Serr

Trachoma Virus —A comprehensive survey is given of the different methods that are employed in culturing trachoma and paratrachoma virus The authors believe that the viruses of the two affections, though very similar are distinct

Calcification of Carotid Artery and Ocular Symptoms —A series of cases together with a review of the relevant literature is advanced to illustrate the frequency of changes of the carotid arteries in association with ocular symptoms that are generally ascribed to chiasmal lesions The importance of radiography is stressed

Berlin vol 139 1938 Heft 1

Operative Closure of Wound in Perforation of Cornea —E Hertel
*Bitot Spots in Affections other than Xerophthalmia —Sie Boen Lian
Unusual Case of Bands in Vitreous —M Wilczek
*Cholesterinosis Bulbi —P M Georgantou
Cholesterin Content of Normal and Opaque Human Lenses —E Bunge
Measurement of Pressure of Intraocular Blood Vessels —K Ascher
Significance of Visual Phenomena —R de Cori
Observations on Physiological Optics and on Psychology of Vision —W Scheidt
*Investigation of Capillaries of Nail bed in Cases of Ocular Disease —F K Leydhecker
Significance of Photoptic Darkness —J Van Essen
Histological Studies in Experimental Herpes of Cornea —K A Reiser
Observations on Near Vision of Myopes —E di Bari

Bitot Spots —Attention is drawn to the occurrence of Bitot spots in Java in conditions of no grave prognostic significance There is a discussion on nineteen such cases observed by the author

Cholesterinosis Bulbi —A distinction is made between a localized lipoid degeneration of the cornea or iris and the invasion of the globe by cholesterin crystals This latter process is held to depend upon an increase of colloids and it is to these appearances that the designation of cholesterinosis should be limited

Investigation of Capillaries —The different methods of studying changes in capillaries are described, together with their application to ophthalmological cases It is concluded that while there is some relationship, the present methods of study are not sufficiently refined to lead to any definite conclusions

Archives of Disease in Childhood

London vol 13 June 1938

Intracranial Haemorrhage in Newborn—W S Crai
Vitamin C Excretion in Children with Particular Reference to Rheumatic Fever—J D Keith and E M H Kmans
Otitis Media and Mastoiditis in Infancy—G McConkey and E C R Cooper
Radiology in Diagnosis of Hypertrophic Pyloric Stenosis—L Findlay
Blood Phosphorus in Egyptian Infants—I A Sabri and M A Abbord
Osteopetrosis—A M Nussey
Coeliac Syndrome in English Child—E G L Bywaters

Intracranial Haemorrhage—A series of 126 infants in whom intracranial haemorrhage was found post mortem are described together with clinical observations during life It is suggested that the health of the mother during pregnancy has an important bearing on intracranial haemorrhage and that the risk of haemorrhage is increased with forceps delivery and when there has been manual interference such as turning The importance of skilled nursing and the dangers of ill considered handling are pointed out Removal to hospital of those infants born at home should be avoided

Hypertrophic Pyloric Stenosis—The findings after a barium meal in cases of hypertrophic pyloric stenosis and in normal children are described The result of this inquiry shows how both vary and thus render the radiographic findings of little value in the diagnosis of hypertrophic pyloric stenosis

Archives of Internal Medicine

Chicago vol 61 June 1938

Experimental Renal Insufficiency produced by Partial Nephrectomy IX Blood Plasma Protein Values for Control and Partially Nephrectomized Rats fed Diets containing Dried Extracted Beef Muscle X Blood Plasma Cholesterol and Phospholipid Phosphorus Values for Control and Partially Nephrectomized Rats fed Diets containing Dried Extracted Liver—S Ludewig and A Chanutin
Size and Shape of Heart in Hyperthyroidism Teleroent enographic Study of 200 Cases—H Gotta
Exophthalmic Goitre Relation between Blood Iodine Level and Duration of Symptoms in 305 Cases—H J Perkin and F H Lahey
Papilloedema associated with Subarachnoid Haemorrhage Experimental and Clinical Study—J Q Griffith jun W A Jeffers and W E Fry
Coexistence of Bronchiectasis and Sinusitis—T W Walsh and O O Meyer
Aneurysm of Innominate Artery—H Parks
Dark Adaptation of Eye and Vitamin A Storage in Young Adults—C Schuck and W O Miller
Bilateral Sporotrichosis of Breast Case Report—J L Wade and A R K Matthews
Blood Review of Recent Literature—F H Bethell R Isaacs S M Goldhamer and C C Sturgis

Papilloedema and Subarachnoid Haemorrhage—Papilloedema is infrequently associated with subarachnoid haemorrhage although the duration of a raised cerebrospinal fluid pressure warrants its appearance Experimentally the development of papilloedema can be prevented by blocking the perineural spaces of the optic nerves and it is inferred that in cases of subarachnoid haemorrhage blood in the cerebrospinal fluid causes such a blocking In a few cases the block is incomplete and papilloedema may occur

Bronchiectasis and Sinusitis—Two thirds of 217 patients with bronchiectasis were found to have associated sinusitis the symptoms of which were unobtrusive The authors show that a few hours after the introduction of iodized oil into the anterior nares of a sleeping person this oil can be demonstrated in the lungs radiographically, and they claim that infected matter from the sinuses reaches the bronchi similarly thus maintaining a bronchitis

Archives d'Ophtalmologie

Paris vol 2 June 1938

*Meningitis of Otitic Origin—O R Kline
Rhinosporidium seeberi—J G Pasternack and C S Alexander
Schwannoma—A M Gnassi and M Borrone

Pharyngeal Cancer—The author discusses the technique used in the treatment of pharyngeal cancer The best results are obtained by the protracted roentgen ray method supplemented in a considerable proportion of cases by the use of interstitial irradiation with radon seeds

Meningitis of Otitic Origin—Two cases of recovery from meningitis following mastoiditis are reported In each case the spinal fluid yielded a pure culture of *Str haemolyticus* In the first case the infection was comparatively mild and there was prompt improvement after one transfusion of convalescent blood The second case was looked upon as desperate the infection having reached the meninges along the line of a former fracture However complete recovery occurred after the administration of sulphanilamide It appears that the recovery of more than 100 patients with haemolytic streptococcal meningitis following the use of sulphanilamide and its derivatives has already been reported

British Journal of Venereal Diseases

London vol 14 July 1938

Relationship of Gonococcal Complement fixation Test to Diagnosis and Treatment of Gonorrhoea—I N O Price and T E Osmond
Chronic Cervicitis—A Bourne
Some Problems in Histopathology of General Paralysis of the Insane—A J Galbraith
Influence of Artificially Induced Fever upon Syphilitic Infection of Mice—A Beck
Gumma of Muscle—S M. Laird

Complement fixation Test—There seems to be a pretty general agreement that this test is very valuable in the management of gonorrhoea both for diagnosis and for test of cure With a suitable technique the reaction is highly specific and sensitive much depends on obtaining a suitable antigen Cross fixation with other Neisseria appears to be rare if it occurs at all Opinions differ as to the interpretation of a positive reaction persisting many months or years after clinical cure but a negative reaction or series of negatives following clinical cure is strong presumptive evidence of bacteriological cure The test is particularly valuable in the differential diagnosis of obscure cases of arthritis epididymitis and salpingitis

Bulletin de l'Association Française pour l Etude du Cancer

Paris vol 27 May 1938

Study of Some of the Physiological Effects of Sulphanilamide I Changes in Acid-base Balance—V E Hartmann V M Percy and H L Barnett

Acid Phosphatase occurring in Serum of Patients with Metastasizing Carcinoma of Prostate Gland—S B Gutman and E B Gutman

Reactions of Human Subjects to Intradermal Purified Type Specific Pneumococcus Polysaccharides—M Heidelberger and J W Brown

Tissue Pressure (Intramuscular Subcutaneous and Intramuscular) as related to Venous Pressure Capillary Filtration and Other Factors—H S Wells J B Youmans and D G Miller jun

Blood of Workmen exposed to High Temperatures—A series of patients presenting symptoms attributable to such exposure was compared with a series of symptom-free workmen exposed to high temperature. The results of the various blood examinations indicated dehydration and decrease of blood sugar over the work period in a majority of controls. In heat sickness the most definite alterations were (*a*) in heat cramps—tendency to blood concentration and decrease of serum chloride (*b*) in heat exhaustion—tendency to blood concentration decrease in blood sugar and lowering of alkali reserve (*c*) in heat retention—consistently high normal serum chloride.

Lowered Resistance to Infection in Diabetes—The blood of diabetic patients was found to possess essentially the same phagocytic bacteriostatic and bactericidal power against selected strains of streptococci as blood from normal controls. Results obtained in individual cases could not be correlated with the duration severity or state of control of the diabetes.

Journal of Industrial Hygiene and Toxicology

Baltimore vol 20 June 1938

Experimental Study of Heat Collapse—J S Weiner

Ventilation of Wire-impregnating Tanks using Chlorinated Hydrocarbons—C P Yaglou F W Sands and P Drinker

Studies on Phenothiazine VI General Toxicity and Blood Changes—J O Thomas J B deNavarre and F De Eds

Toxicity of Isopropranol—H J Morris and H D Lubitsky

Experimental Investigations concerning Liability to Silicosis among Workmen in Iron Mines—C Naeslund

Heat Collapse—Heat collapse can be induced in most persons by prolonged standing in a still hot humid atmosphere. The cause is excessive peripheral vasodilatation causing a fall of blood pressure slowing of the heart and consequent anaemia of the brain. In certain individuals there is a compensatory acceleration of the heart beat. Adequate movement of air as a preventive is discussed.

Experimental Silicosis—Animal experiments for the production of silicosis are described. Iron ores (Swedish) containing up to 5 per cent silica gave negative results. With highly siliceous ores—for example leptite (60 per cent silica)—silicosis occurred but not so readily as with pure quartz dust. Granitic not ferric particles constitute the chief danger to iron miners.

Journal of Pharmacology and Experimental Therapeutics

Concerning Polycoria—K Lisch

Operative Treatment of Traumatic Iridodialysis—Z Nizetic

Perforating Injuries of Ciliary Body—E Ochs

Studies of Visual Field with Lumineux Perimeter—B v Herrath and L Németh

Periarterial Sympathectomy—Drawing upon the teachings of Leriche and its ophthalmological applications by Magitot the authors have performed sympathectomy with excision of the carotid body in a series of cases. The results obtained towards the end of their series showed that the circulation of the retina can be influenced by this operation. The changes are however transient. More promising results may be obtained if in addition to this operation the tension in the eye is also reduced.

Degeneratio Hyaloideo-retinalis Hereditaria—A familial group is reported which showed an optically empty vitreous containing some strands and fundus changes notably white bands on the periphery extending along the terminal arteries.

Spasm of Upper Lid—V Adda

Familial Ptosis and Ophthalmoplegia of Supranuclear Type—J Scharf

Dissociated Squint and Other Ocular Dissimilarities in Uniovular Twins—G Jancke

Corneal Transplantations—A detailed account is given of the technique and difficulties experienced in seventy-eight corneal transplantations done by the author since 1921. It is emphasized that the operation requires no greater dexterity than other intraocular procedures and in the author's series since 1930 52 per cent of transplantations were clear and 19 per cent semi-transparent in 29 per cent the graft became opaque.

Eye Symptoms in Tumours of Epipharynx—On the basis of three cases the author draws attention to the fact that atypical symptoms involving the motor sensory and sympathetic fibres of the eye may find their origin in tumours of the epipharynx.

Medicine

Baltimore vol 17 May 1938

Mammalian Blood Platelets in Health and Disease—L M Tocantins

Blood Platelets—The physico-chemical properties production distribution utilization and destruction of blood platelets are reviewed. In each section the physiology is first considered and then the possible ways in which aberration of these normal processes may give rise to disease is discussed in the light of known information. The review is exhaustive and will appeal mainly to those who have already special knowledge of this field.

*Roentgen Studies of Jejunum in Pulmonary Tuberculosis —S Fineman
Standard Sputum Requirements —I D Bortowitz and J L Leon
Tubercle Bacillus Part IV —S A Petroff

Jejunum in Pulmonary Tuberculosis —Jejunal pattern abnormalities were found in 6 per cent of the seventy-five cases examined The author does not consider that these were due to tuberculous ulcerations of the jejunum or to tuberculous peritonitis He suggests that vitamin and mineral deficiency may be a factor in the production of these appearances

Tuberculosis in British Guiana II —E Cochrane
Preparation of Tuberculin Ointment of Constant Strength —K A Jensen
Carbon Dioxide Inhalation in Pulmonary Tuberculosis —A L Banyai

Old Tuberculin and Purified Tuberculin —This is an extensive study of the standardization and preparation of stable dilutions of these two products By diluting old tuberculin in a buffer solution of *p*H 7 38, and adding 0 01 per cent quinosol a dilution containing 1/100 mg per 0 1 c cm keeps well for about two months A description is given of the preparation of a purified tuberculin that dissolves in a clear solution of *p*H 7 38 In contrast to other preparations of purified tuberculin, including P P D this solution gives no precipitate when quinosol is added as antiseptic Standardization of purified tuberculin in relation to the international standard tuberculin is not practicable by means of the intracutaneous method usually employed A comparison of the standard tuberculin with the purified tuberculin on the principles followed by American investigators has shown that in Denmark it is practicable to use two doses of purified tuberculin for the performance of the Mantoux test—namely, 1/50,000 mg and 1/500 mg Dilutions suitable for these two doses can be prepared so as to remain stable for one month

*Origin and Nature of Deformation of Femoral Head after Reduction of Congenital Dislocation of Hip —S Nagura

Femoral Head Deformity after Reduction of Congenital Dislocation —According to the author the deformity of the femoral head observed after reduction in cases of congenital dislocation of the hip is due to mechanical trauma His experimental and clinical observations lead him to the conclusion that the condition is identical with Perthes s disease

WHY AGAROL BRAND COMPOUND FOR CONSTIPATION ?

Among the curative measures advocated for overcoming constipation, none has proved more consistently successful than AGAROL — the original emulsion of mineral oil and agar-agar with phenolphthalein

Agarol renders the fæcal mass plastic and pliable with unabsorbable moisture It lubricates the intestinal tract and gently stimulates peristalsis, ensuring an easy and complete evacuation

Used over a reasonable period, Agarol gradually restores muscular tone and functional activity of the bowel, with the gratifying assurance that natural evacuation will follow without the need for further medication

Supplied in 4½ oz 7½ oz and 17 oz bottles

Agarol is not advertised to the public

Trial supplies to Members of the Medical Profession on request

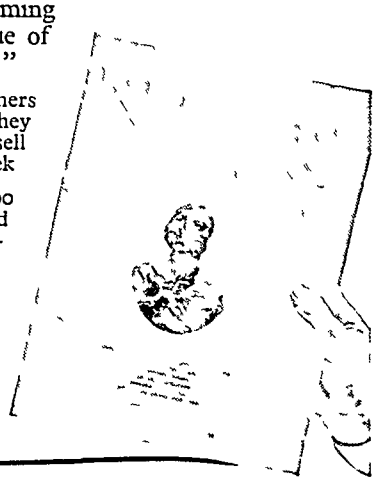
NURSING PROFESSION'S GREAT WELCOME FOR NEW WEEKLY

Success of "Nursing Illustrated" exceeds all expectations

THE REASON WHY

CREDIT for the gratifying success of "Nursing Illustrated" is not wholly the publishers' Much of the credit goes to the Doctors, Surgeons, Matrons, Sisters and Nurses who helped frame its policy



"Nursing Illustrated" is a *planned*, not an accidental, success

Before the first Table of Contents was drafted, representatives from every branch of the medical profession were called together

Their ideas were solicited and compiled, and from the best of them a first issue was produced

But this issue was never sold It was tried out on the staff of a big hospital That staff said fully and freely what they thought

This experiment made it clear that what nurses wanted was a paper with information about new treatments, how new ideas in medicine and surgery will affect nurses' work Special articles by famous authorities—simply written, generously illustrated—latest news on clothes, beauty care, films, physical fitness, books and all off-duty activities It was given them, brimming over, in the first issue of "Nursing Illustrated"

Naturally the publishers expected a success They hoped before long to sell 40,000 copies a week

They sold over 40,000 *copies the first issue*, and thousands more succeeding issues And the demand is still growing

Have you yet seen a copy? The September 23rd issue will be on the newsstands on Friday

Features of Forthcoming Issues

Hospital in a Medicine Chest—Obstetric History of the Wives of Henry VIII—The Surgical Knife—Midwifery and Other Customs in West Africa—The Case of Mary Blandy — Thoracic Surgery, Hugh Reid — Trigeminal Neuralgia—Pneumonia (Nursing)—Osteomyelitis X-ray—Biography (Liston and Hugh Owen Thomas)—Anatomy Accessory Organs of digestion—Bandage Series

Medical Men supervised the design of the Linia Belt

The Belt for correction of Ptosis Obesity, Faulty Posture and for post operation wear

It was on the advice of medical men that the Linia Belt was evolved Frequent tests by doctors were carried out before it was made available for sale That is why it is the recognised belt for men's wear

Made to measure for every case the Linia Belt is prescribed for obesity, for various ptotic conditions, for post-operation wear, for wear by the older man during golf and so on The front is of thin non elastic tricot, the back of strong elastic It is fully adjustable by means of slide buckles

YOU CAN ORDER BY POST

Perfect fitting guaranteed or money refunded in full We make a reduction of 2/ in the £ on purchases for personal use to members of the Medical Profession May we send you a fully explanatory booklet?

INCORPORATING THE ROSS INSTITUTE

POSTS OVERSEAS FOR MEDICAL MEN

A register is kept in the School of medical men who are prepared to be considered for posts overseas, and the School is frequently asked to advise plantation and mining companies when such posts fall vacant

The salaries offered are attractive, conditions of service are governed by standardised forms of contract, and many of the posts offer to medical men a most interesting field in which to practise their profession

It is desirable that candidates for posts overseas should hold a diploma in tropical medicine and hygiene The course provided by the London School for the Conjoint Board's Diploma lasts six months and the tuition fee is £40 The course may be taken from October to March or from January to June There are generally more vacancies in the course commencing in January

The Director of the Ross Institute is always glad to interview medical men who would like information regarding the possibilities of a career overseas if they will be good enough to make an appointment to call on him Enquiries may be addressed to

ROYAL NAVAL MEDICAL SERVICE

Vacancies exist for Medical Officers in the Royal Navy, and applications are invited for entry in January, 1939

Candidates below the age of 28 years are preferred, and they must be registered under the Medical Acts No examination in professional subjects will be held, but candidates will be required to attend for interview by a Selection Board

Selected candidates will be entered for Service for a period of three years, which if desired is usually extended to five years at the discretion of the Admiralty

Officers who leave the Service at the end of the initial period of three years will be eligible for a gratuity of £400, and those who leave at the end of five years for a gratuity of £1,000

At the end of five years' Short Service, permanent commissions will be given to selected officers who wish to make the Naval Medical Service their permanent career Officers transferred to the permanent list will receive a gratuity of £1,000 (less Income Tax)

Full opportunities exist for transfer to the permanent list, and periods of unemployed or half pay are very rare The assistance of private income is not necessary for the purpose of supplementing official pay and allowances

Opportunities are available for officers on the permanent list for postgraduate study, to specialise, to take higher examinations, and to obtain further qualifications

Copies of the regulations for entry and conditions of service, including rates of pay, allowances and retired pay, may be obtained from the Medical Director-General of the Navy, Admiralty, S W 1, and from the Deans of all Medical Schools

Applications for entry from intending candidates must be received not later than November 21st, 1938

ROYAL ARMY MEDICAL CORPS

Applications are invited from medical men for appointment to commissions in the Royal Army Medical Corps

Candidates will, for the present, be selected for commissions without competitive examination, and will be required to present themselves in London for physical examination and interview on, or about, 21st October, 1938 They must be registered under the Medical Acts, and normally must not be over the age of 28 years

Successful candidates will, in the first instance, be given short service commissions for five years *During the 4th year of this period* they will be given the opportunity of applying for permanent commissions in either the Royal Army Medical Corps or the Indian Medical Service Those not selected will retire on completion of five years' service with a gratuity of £1,000

Candidates who are successful will, unless they are seconded to complete a hospital appointment, assemble at the Royal Army Medical College, London, on 1st November, 1938

Particulars of the Conditions of Service in the Royal Army Medical Corps, pay and allowances, and forms of application, may be obtained on application, either in writing, or personally, to the Assistant Director General, Army Medical Services, The War Office, London, S W 1.

INDIAN MEDICAL SERVICE

RECRUITMENT OF EUROPEAN OFFICERS

Applications are invited from Medical Men for Permanent Commissions in His Majesty's Indian Medical Service The terms offered include a gratuity of £1 000 on retirement after six years service or of £2,500 after 12 years service together with free return passages for those who no longer desire to remain in the Service In other respects the terms will be as detailed below

British subjects of pure European descent who are under 32 years of age who are registered under the Medical Acts in force in Great Britain and Northern Ireland are eligible to apply

CAREERS

The Indian Medical Service offers a permanent career with wide opportunities of medical experience including clinical preventive specialist and research work At the beginning of his career an officer is employed on the military side which has medical charge of the Indian Army Promotion is on a time scale up to the rank of Lieutenant Colonel and by selection to the ranks of Colonel and Major General An officer may apply after one year's Indian Service to have his name registered for transfer to the civil side from which appointments are made to Civil Surgeoncies which are established at the principal civil centres to provide for the medical needs of Civil Officials and for general medical administrative purposes to specialist (for example public health and bacteriological) services to research posts and to professorships at the Medical Schools

24 " "	£614 0s
" 25 "	£651 0s
" 26 " "	£697 10s
" 27 " " "	£744 0s

There are additional pensions ranging from £65 to £300 per annum for officers who have held administrative appointments

PASSAGES

An officer on appointment is provided with free passage to India The families of officers who are married prior to the date of the officers embarkation on first appointment will also be provided with free passage to India subject to the payment of messing charges Officers and their families are also eligible for passage concessions under which they are granted a certain number of return passages home at Government expense during their service

INSTRUCTION PRIOR TO EMBARKATION

Officers are required to undergo courses of instruction at the Royal Army Medical College and at Aldershot lasting approximately three months prior to their embarkation for India on first appointment Information as to the rates of pay admissible during this period and subsequently up to arrival in India is contained in the memorandum referred to below

A memorandum giving full details regarding these appointments and forms of application may be obtained from the UNDER SECRETARY OF STATE FOR INDIA MILITARY DEPARTMENT INDIA OFFICE LONDON S W 1 The Selection Committee will meet at the India Office on 11th October 1938 next and the selected candidates unless seconded for hospital appointment will be required to join a course of instruction commencing on 1st November prior to sailing for India in February 1939 Applications should reach the India Office as soon as possible

INDIA OFFICE SEPTEMBER 1938

Appointments for Medical Officers in the ROYAL AIR FORCE

Medical men are invited to apply for Short Service Commissions in the Royal Air Force. Candidates must be registered under the Medical Acts and be not more than 31 years of age on entry.

The period of service is 3 years—extendible to 5 years. A gratuity of £400 or £1,000 is payable at the termination of 3 or 5 years respectively. Permanent commissions are awarded in a number of cases. These offer a pensionable career with the opportunity of extra leave on full pay for specialised study. Applicants who hold—or are likely to hold—post graduate appointments in civil hospitals may, on joining the Royal Air Force, be seconded until the termination of their appointments (for a period not exceeding one year). An interval of commission up to twelve months is allowed for appointments held at approved hospitals.

Fuller information can be obtained from The Director of Medical Services, Air Ministry, Kingsway, London.

NEW ZEALAND

DEPARTMENT OF HEALTH WELLINGTON

APPOINTMENT OF SCHOOL MEDICAL OFFICERS

Applications are invited from duly qualified and registered medical practitioners (women) for the above appointments. Candidates must possess a registrable qualification in New Zealand and should have had at least two years experience in the practice of their profession. They should be under 40 years of age. Salary scale £515 per annum and thereafter by annual increments of £50 to £665 per annum with prospects of an ultimate maximum of £715 per annum. The commencing salary may be at any point within the scale according to age and experience.

The duties include the routine medical inspection of school children, addresses to the children and periodic lectures to teachers, parents and the general public, and the inspection and report on school buildings in regard to overcrowding, cleanliness, sanitation, lighting and ventilation.

Successful applicants will require to commence duty in New Zealand in February 1939. Reasonable costs of transport to New Zealand will be paid.

Applications close on October 15th 1938 with the High Commissioner for New Zealand, 415 Strand, London, W.C.2, from whom printed particulars giving the terms of appointment may be obtained.

CITY OF BIRMINGHAM MENTAL HOSPITAL

WINSON GREEN DIVISION

JUNIOR LADY ASSISTANT MEDICAL OFFICER

The Committee of Visitors invite applications from single ladies who are duly qualified and registered Medical Practitioners for the position of Junior Lady Assistant Medical Officer. The successful candidate will be required to reside in the Hospital.

The commencing salary will be £150 per annum plus the usual residential emoluments of board, lodging, laundry and attendance. An increase of £10 will be granted on completion of twelve months' satisfactory service and thereafter increases of £5 per annum up to a maximum salary of £200 per annum. An additional £50 per annum will be paid to a holder of the D.P.M. qualification or to a person obtaining the D.P.M. after appointment. All fees received in connection with panel work will be required to be paid into the Borough Funds but for making insurance reports, reports on compensation cases and Coroner's inquests the fees can be retained.

A person who has held for at least six months a medical or surgical residential post in a General Hospital will be regarded as having an additional qualification. Previous mental hospital experience is not essential but experience in the administration of anaesthetics is desired.

The candidate appointed will be required to pass a medical examination and will be placed on the permanent staff after one year's satisfactory service when she will be required to contribute under the Asylums Officers Superannuation Act, 1909. She will be required to serve in such institution belonging to the Mental Hospitals Committee as they may from time to time direct. The appointment is subject to one month's notice on either side.

Applications stating full particulars of qualifications, experience and appointments held, accompanied by copies of three recent testimonials, must be addressed to the undersigned so as to be received not later than September 24th, 1938. Canvassing either directly or indirectly will be a disqualification.

Town Clerk's Office, Council House, Birmingham 1. F. H. C. WILTSHIRE, Clerk to the Committee of Visitors.

CITY OF BIRMINGHAM MENTAL HOSPITAL

WINSON GREEN DIVISION

DEPUTY MEDICAL SUPERINTENDENT

The Committee of Visitors invite applications from duly qualified medical men for the position of Deputy Medical Superintendent of the Winson Green Division at a commencing salary of £625 per annum, plus residential emoluments consisting of unfurnished quarters, coal, light and laundry valued for superannuation purposes at £110 per annum. The above emoluments are for a married man, but if a single man is appointed they will consist of board, lodging and laundry.

Applicants must have had several years' experience in Mental Hospital practice and must possess the Diploma in Psychological Medicine. A person who has held for at least six months a medical or surgical residential post in a General Hospital will be regarded as having an additional qualification. The successful candidate must be a good Anaesthetist.

The candidate appointed will be required to pass a medical examination and to contribute under the Asylums Superannuation Act, 1909. He must also devote the whole of his time to the duties of the office and will not be permitted to engage in any other work.

All fees received in connexion with panel work will be required to be paid into the Borough Funds but for making insurance reports, reports on compensation cases and Coroner's inquests the fees can be retained.

The appointment is subject to one month's notice on either side, and the successful candidate will be required to serve in such Institution belonging to the Mental Hospitals Committee as they may from time to time direct.

Applications endorsed "Deputy Medical Superintendent, Winson Green," stating age, full particulars and qualifications, experience and appointments held, accompanied by copies of three recent testimonials, must be addressed to the undersigned so as to be received not later than September 28th, 1938. Canvassing either directly or indirectly will be a disqualification.

Town Clerk's Office, Council House, Birmingham 1. F. H. C. WILTSHIRE, Clerk to the Committee of Visitors.

DARLINGTON MEMORIAL HOSPITAL

The Committee invite applications for the post of HONORARY ANAESTHETIST. Every candidate for the office of Honorary Anaesthetist must be on the Medical Register and be a Graduate in Medicine of a University of the United Kingdom or a Fellow or Member of one of the Royal Colleges of Surgeons of the United Kingdom.

Particulars of the appointment may be obtained from—ARTHUR RIDDLE, M.C.I.S., Memorial Hospital, Darlington.

COUNTY COUNCIL OF DURHAM

EDUCATION DEPARTMENT

ASSISTANT SCHOOL MEDICAL OFFICERS

The County Education Committee invite applications for the posts of Two Assistant School Medical Officers (women) to act under the School Medical Officer in connexion with the inspection of school children and such other duties as may be required by the Education Committee

Commencing salary in each case £400 per annum (provided the candidate has had not less than three years' postgraduate experience) rising by annual increments of £25 to £500 per annum together with travelling expenses according to the County Scale. The successful candidates will be required to devote their whole time to the duties of the office and reside in or near the districts to which they will be attached at places to be approved by the Education Committee. The appointments will be subject to three calendar months' notice on either side expiring on the last day of any calendar month

Applicants must have had experience in the work of school medical inspection and preference will be given to candidates who

(a) have had experience in the work of School Clinics,

(b) have been accustomed to make special reports on Mentally Defective Physically Defective Epileptic and other Defective Children

The possession of a Diploma in Public Health is desirable though not essential

Canvassing directly or indirectly is prohibited and will disqualify

A deduction of 5 per cent will be made from the salary in each case in accordance with the Local Government and Other Officers' Superannuation Act 1922 and the appointments will be subject to the candidates passing the medical examination in connexion therewith

Form of application to be returned not later than Saturday October 8th 1938 will be supplied by the Director of Education Shire Hall Durham on receipt of a stamped addressed foolscap envelope

Growing children away at School generally need nothing more than the ordinary care which they get and with plenty of fresh air good food and exercise they usually come back at the end of the term in the pink of condition

But if there is a term when the parent feels a little anxious this definitely is the one and if the boy or girl at school is one of those who grows more quickly than the normal or who has had an illness during the holiday there may be trouble during the school term if they follow the same routine as the hardy ones

Doctors who know of such cases would earn the lasting gratitude of the parents if they said Put a jar of Numol in the tuck box

Numol is a concentrated source of elements proved by scientific test to be beneficial for weakened nerves and constitutions and has a high content of all the vitamins other than the anti scorbutic

Doctors are invited to write for a booklet specially published for the use of the Profession

NUMOL

FORTIFIES AGAINST THE ILLNESSES OF CHILDHOOD
